

## Features

- Incorporates the ARM926EJ-S™ ARM® Thumb® Processor
  - DSP Instruction Extensions
  - ARM Jazelle® Technology for Java® Acceleration
  - 16 Kbyte Data Cache, 16 Kbyte Instruction Cache, Write Buffer
  - 210 MIPS at 190 MHz
  - Memory Management Unit
  - EmbeddedICE™, Debug Communication Channel Support
  - Mid-level implementation Embedded Trace Macrocell™
- Additional Embedded Memories
  - 32 Kbytes of Internal ROM, Single-cycle Access at Maximum Bus Speed
  - 160 Kbytes of Internal SRAM, Single-cycle Access at Maximum Processor or Bus Speed
- External Bus Interface (EBI)
  - Supports SDRAM, Static Memory, NAND Flash and CompactFlash®
- LCD Controller
  - Supports Passive or Active Displays
  - Up to 16-bits per Pixel in STN Color Mode
  - Up to 16M Colors in TFT Mode (24-bit per Pixel), Resolution up to 2048 x 2048
- USB
  - USB 2.0 Full Speed (12 Mbits per second) Host Double Port
    - Dual On-chip Transceivers
    - Integrated FIFOs and Dedicated DMA Channels
  - USB 2.0 Full Speed (12 Mbits per second) Device Port
    - On-chip Transceiver, 2 Kbyte Configurable Integrated FIFOs
- Bus Matrix
  - Handles Five Masters and Five Slaves
  - Boot Mode Select Option
  - Remap Command
- Fully Featured System Controller (SYSC) for Efficient System Management, including
  - Reset Controller, Shutdown Controller, Four 32-bit Battery Backup Registers for a Total of 16 Bytes
  - Clock Generator and Power Management Controller
  - Advanced Interrupt Controller and Debug Unit
  - Periodic Interval Timer, Watchdog Timer and Real-time Timer
  - Three 32-bit PIO Controllers
- Reset Controller (RSTC)
  - Based on Power-on Reset Cells, Reset Source Identification and Reset Output Control
- Shutdown Controller (SHDWC)
  - Programmable Shutdown Pin Control and Wake-up Circuitry
- Clock Generator (CKGR)
  - 32,768 Hz Low-power Oscillator on Battery Backup Power Supply, Providing a Permanent Slow Clock
  - 3 to 20 MHz On-chip Oscillator and two PLLs
- Power Management Controller (PMC)
  - Very Slow Clock Operating Mode, Software Programmable Power Optimization Capabilities
  - Four Programmable External Clock Signals

## AT91 ARM Thumb-based Microcontrollers

### AT91SAM9261

## Preliminary

## Summary

**NOTE:** This is a summary document.  
The complete document is available on  
the Atmel website at [www.atmel.com](http://www.atmel.com).

6062JS-ATARM-06-Feb-08

- **Advanced Interrupt Controller (AIC)**
  - Individually Maskable, Eight-level Priority, Vectored Interrupt Sources
  - Three External Interrupt Sources and One Fast Interrupt Source, Spurious Interrupt Protected
- **Debug Unit (DBGU)**
  - 2-wire USART and support for Debug Communication Channel, Programmable ICE Access Prevention
- **Periodic Interval Timer (PIT)**
  - 20-bit Interval Timer plus 12-bit Interval Counter
- **Watchdog Timer (WDT)**
  - Key Protected, Programmable Only Once, Windowed 12-bit Counter, Running at Slow Clock
- **Real-Time Timer (RTT)**
  - 32-bit Free-running Backup Counter Running at Slow Clock
- **Three 32-bit Parallel Input/Output Controllers (PIO) PIOA, PIOB and PIOC**
  - 96 Programmable I/O Lines Multiplexed with up to Two Peripheral I/Os
  - Input Change Interrupt Capability on Each I/O Line
  - Individually Programmable Open-drain, Pull-up Resistor and Synchronous Output
- **Nineteen Peripheral DMA (PDC) Channels**
- **Multimedia Card Interface (MCI)**
  - SDCard and MultiMediaCard™ Compliant
  - Automatic Protocol Control and Fast Automatic Data Transfers with PDC, MMC and SDCard Compliant
- **Three Synchronous Serial Controllers (SSC)**
  - Independent Clock and Frame Sync Signals for Each Receiver and Transmitter
  - I<sup>2</sup>S Analog Interface Support, Time Division Multiplex Support
  - High-speed Continuous Data Stream Capabilities with 32-bit Data Transfer
- **Three Universal Synchronous/Asynchronous Receiver Transmitters (USART)**
  - Individual Baud Rate Generator, IrDA® Infrared Modulation/Demodulation
  - Support for ISO7816 T0/T1 Smart Card, Hardware and Software Handshaking, RS485 Support
- **Two Master/Slave Serial Peripheral Interface (SPI)**
  - 8- to 16-bit Programmable Data Length, Four External Peripheral Chip Selects
- **One Three-channel 16-bit Timer/Counters (TC)**
  - Three External Clock Inputs, Two multi-purpose I/O Pins per Channel
  - Double PWM Generation, Capture/Waveform Mode, Up/Down Capability
- **Two-wire Interface (TWI)**
  - Master Mode Support, All Two-wire Atmel EEPROMs Supported
- **IEEE® 1149.1 JTAG Boundary Scan on All Digital Pins**
- **Required Power Supplies:**
  - 1.08V to 1.32V for VDDCORE and VDDBU
  - 3.0V to 3.6V for VDDOSC and for VDDPLL
  - 2.7V to 3.6V for VDDIOP (Peripheral I/Os)
  - 1.65V to 1.95V and 3.0V to 3.6V for VDDIOM (Memory I/Os)
- **Available in a 217-ball LFBGA RoHS-compliant Package**

## 1. Description

The AT91SAM9261 is a complete system-on-chip built around the ARM926EJ-S ARM Thumb processor with an extended DSP instruction set and Jazelle Java accelerator. It achieves 210 MIPS at 190 MHz.

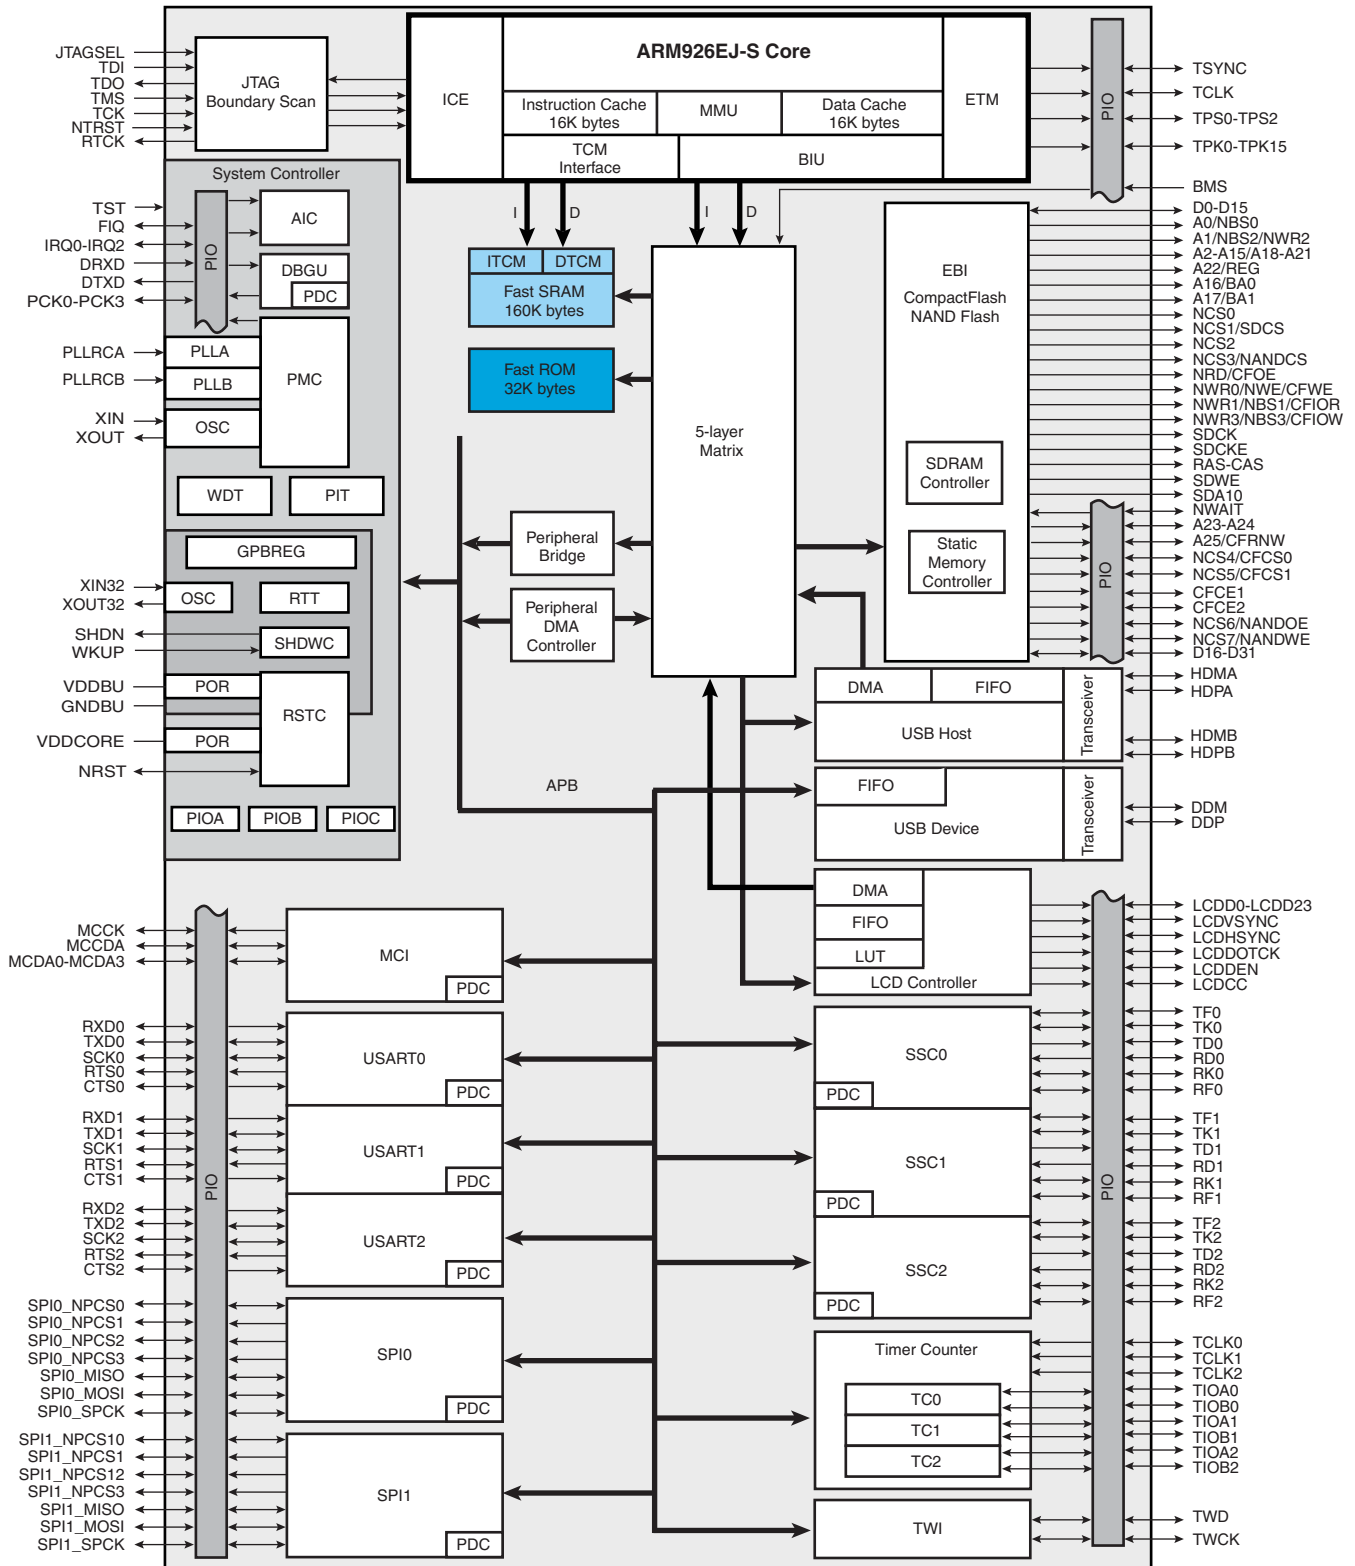

The AT91SAM9261 is an optimized host processor for applications with an LCD display. Its integrated LCD controller supports BW and up to 16M color, active and passive LCD displays. The 160 Kbyte integrated SRAM can be configured as a frame buffer minimizing the impact for LCD refresh on the overall processor performance. The External Bus Interface incorporates controllers for synchronous DRAM (SDRAM) and Static memories and features specific interface circuitry for CompactFlash and NAND Flash.

The AT91SAM9261 integrates a ROM-based Boot Loader supporting code shadowing from, for example, external DataFlash<sup>®</sup> into external SDRAM. The software controlled Power Management Controller (PMC) keeps system power consumption to a minimum by selectively enabling/disabling the processor and various peripherals and adjustment of the operating frequency.

The AT91SAM9261 also benefits from the integration of a wide range of debug features including JTAG-ICE, a dedicated UART debug channel (DBGU) and an embedded real time trace. This enables the development and debug of all applications, especially those with real-time constraints.

## 3. Signal Description

**Table 3-1.** Signal Description by Peripheral

Signal Name	Function	Type	Active Level	Comments
<b>Power</b>				
VDDIOM	EBI I/O Lines Power Supply	Power		1.65 V to 1.95V and 3.0V to 3.6V
VDDIOP	Peripherals I/O Lines Power Supply	Power		2.7V to 3.6V
VDDBU	Backup I/O Lines Power Supply	Power		1.08V to 1.32V
VDDPLL	PLL Power Supply	Power		3.0V to 3.6V
VDDOSC	Oscillator Power Supply	Power		3.0V to 3.6V
VDDCORE	Core Chip Power Supply	Power		1.08V to 1.32V
GND	Ground	Ground		
GNDPLL	PLL Ground	Ground		
GNDOSC	Oscillator Ground	Ground		
GNDBU	Backup Ground	Ground		
<b>Clocks, Oscillators and PLLs</b>				
XIN	Main Oscillator Input	Input		
XOUT	Main Oscillator Output	Output		
XIN32	Slow Clock Oscillator Input	Input		
XOUT32	Slow Clock Oscillator Output	Output		
PLLRCFA	PLL Filter	Input		
PLLRCB	PLL Filter	Input		
PCK0 - PCK3	Programmable Clock Output	Output		
<b>Shutdown, Wakeup Logic</b>				
SHDN	Shutdown Control	Output		Do not tie over VDDBU.
WKUP	Wake-Up Input	Input		Accepts between 0V and VDDBU.
<b>ICE and JTAG</b>				
TCK	Test Clock	Input		No pull-up resistor.
RTCK	Returned Test Clock	Output		No pull-up resistor.
TDI	Test Data In	Input		No pull-up resistor.
TDO	Test Data Out	Output		
TMS	Test Mode Select	Input		No pull-up resistor.
NTRST	Test Reset Signal	Input	Low	Pull-up resistor.
JTAGSEL	JTAG Selection	Input		Pull-down resistor. Accepts between 0V and VDDBU.
<b>ETM™</b>				
TSYNC	Trace Synchronization Signal	Output		
TCLK	Trace Clock	Output		
TPS0 - TPS2	Trace ARM Pipeline Status	Output		
TPK0 - TPK15	Trace Packet Port	Output		

**Table 3-1.** Signal Description by Peripheral (Continued)

Signal Name	Function	Type	Active Level	Comments
<b>Reset/Test</b>				
NRST	Microcontroller Reset	I/O	Low	Pull-up resistor
TST	Test Mode Select	Input		Pull-down resistor.
BMS	Boot Mode Select	Input		
<b>Debug Unit</b>				
DRXD	Debug Receive Data	Input		
DTXD	Debug Transmit Data	Output		
<b>AIC</b>				
IRQ0 - IRQ2	External Interrupt Inputs	Input		
FIQ	Fast Interrupt Input	Input		
<b>PIO</b>				
PA0 - PA31	Parallel IO Controller A	I/O		Pulled-up input at reset
PB0 - PB31	Parallel IO Controller B	I/O		Pulled-up input at reset
PC0 - PC31	Parallel IO Controller C	I/O		Pulled-up input at reset
<b>EBI</b>				
D0 - D31	Data Bus	I/O		Pulled-up input at reset
A0 - A25	Address Bus	Output		0 at reset
NWAIT	External Wait Signal	Input	Low	
<b>SMC</b>				
NCS0 - NCS7	Chip Select Lines	Output	Low	
NWR0 - NWR3	Write Signal	Output	Low	
NRD	Read Signal	Output	Low	
NWE	Write Enable	Output	Low	
NBS0 - NBS3	Byte Mask Signal	Output	Low	
<b>CompactFlash Support</b>				
CFCE1 - CFCE2	CompactFlash Chip Enable	Output	Low	
CFOE	CompactFlash Output Enable	Output	Low	
CFWE	CompactFlash Write Enable	Output	Low	
CFIOR	CompactFlash IO Read	Output	Low	
CFIOW	CompactFlash IO Write	Output	Low	
CFRNW	CompactFlash Read Not Write	Output		
CFCS0 - CFCS1	CompactFlash Chip Select Lines	Output	Low	
<b>NAND Flash Support</b>				
NANDOE	NAND Flash Output Enable	Output	Low	
NANDWE	NAND Flash Write Enable	Output	Low	
NANDCS	NAND Flash Chip Select	Output	Low	

**Table 3-1.** Signal Description by Peripheral (Continued)

Signal Name	Function	Type	Active Level	Comments
<b>SDRAM Controller</b>				
SDCK	SDRAM Clock	Output		
SDCKE	SDRAM Clock Enable	Output	High	
SDCS	SDRAM Controller Chip Select	Output	Low	
BA0 - BA1	Bank Select	Output		
SDWE	SDRAM Write Enable	Output	Low	
RAS - CAS	Row and Column Signal	Output	Low	
SDA10	SDRAM Address 10 Line	Output		
<b>Multimedia Card Interface</b>				
MCKK	Multimedia Card Clock	Output		
MCCDA	Multimedia Card A Command	I/O		
MCDA0 - MCDA3	Multimedia Card A Data	I/O		
<b>USART</b>				
SCK0 - SCK2	Serial Clock	I/O		
TXD0 - TXD2	Transmit Data	Output

HDP A	USB Host Port A Data +	Analog		
HDMB	USB Host Port B Data -	Analog		
HDPB	USB Host Port B Data +	Analog		

## 4. Package and Pinout

The AT91SAM9261 is available in a 217-ball LFBGA RoHS-compliant package, 15 x 15 mm, 0.8 mm ball pitch

### 4.1 217-ball LFBGA Package Outline

Figure 4-1 shows the orientation of the 217-ball LFBGA Package.

A detailed mechanical description is given in the section “AT91SAM9261 Mechanical Characteristics” of the product datasheet.

**Figure 4-1.** 217-ball LFBGA Package Outline (Top View)

## 4.2 Pinout

**Table 4-1. AT91SAM9261 Pinout for 217-ball LFBGA Package <sup>(1)</sup>**

Pin	Signal Name	Pin	Signal Name	Pin	Signal Name	Pin	Signal Name

Note: 1. Shaded cells define the pins powered by VDDIOM.

## 5. Power Considerations

### 5.1 Power Supplies

The AT91SAM9261 has six types of power supply pins:

- VDDCORE pins: Power the core, including the processor, the memories and the peripherals; voltage ranges from 1.08V and 1.32V, 1.2V nominal.
- VDDIOM pins: Power the External Bus Interface I/O lines; voltage ranges from 1.65V to 1.95V and 3.0V to 3.6V, 1.8V and 3.3V nominal.
- VDDIOP pins: Power the Peripheral I/O lines and the USB transceivers; voltage ranges from 2.7V and 3.6V, 3.3V nominal.
- VDDBU pin: Powers the Slow Clock oscillator and a part of the System Controller; voltage ranges from 1.08V and 1.32V, 1.2V nominal.
- VDDPLL pin: Powers the PLL cells; voltage ranges from 3.0V and 3.6V, 3.3V nominal.
- VDDOSC pin: Powers the Main Oscillator cells; voltage ranges from 3.0V and 3.6V, 3.3V nominal.

The double power supplies VDDIOM and VDDIOP are identified in [Table 4-1 on page 10](#). These supplies enable the user to power the device differently for interfacing with memories and for interfacing with peripherals.

Ground pins GND are common to VDDCORE, VDDIOM and VDDIOP pins power supplies. Separated ground pins are provided for VDDBU, VDDOSC and VDDPLL. The ground pins are GNDBU, GNDOSC and GNDPLL, respectively.

### 5.2 Power Consumption

The AT91SAM9261 consumes about 550  $\mu$ A of static current on VDDCORE at 25°C. This static current rises at up to 5.5 mA if the temperature increases to 85°C.

On VDDBU, the current does not exceed 3  $\mu$ A @25°C, but can rise at up to 20  $\mu$ A @85°C.

For dynamic power consumption, the AT91SAM9261 consumes a maximum of 50 mA on VDDCORE at maximum speed in typical conditions (1.2V, 25°C), processor running full-performance algorithm.

## 6. I/O Line Considerations

### 6.1 JTAG Port Pins

TMS, TDI and TCK are Schmitt trigger inputs and have no pull-up resistors.

TDO and RTCK are outputs, driven at up to VDDIOP, and have no pull-up resistor.

The JTAGSEL pin is used to select the JTAG boundary scan when asserted at a high level (tied to VDDBU). It integrates a permanent pull-down resistor of about 15 k $\Omega$  to GNDBU, so that it can be left unconnected for normal operations.

The NTRST pin is used to initialize the embedded ICE TAP Controller when asserted at a low level. It integrates a permanent pull-up resistor of about 15 k $\Omega$  to VDDIOP, so that it can be left unconnected for normal operations.

## 6.2 Test Pin

The TST pin is used for manufacturing test purposes when asserted high. It integrates a permanent pull-down resistor of about 15 k $\Omega$  to GNDBU, so that it can be left unconnected for normal operations. Driving this line at a high level leads to unpredictable results.

## 6.3 Reset Pin

NRST is an open-drain output integrating a non-programmable pull-up resistor. It can be driven with voltage at up to VDDIOP. As the product integrates power-on reset cells, the NRST pin can be left unconnected in case no reset from the system needs to be applied to the product.

The NRST pin integrates a permanent pull-up resistor of 100 k $\Omega$  minimum to VDDIOP.

The NRST signal is inserted in the Boundary Scan.

## 6.4 PIO Controller A, B and C Lines

All the I/O lines PA0 to PA31, PB0 to PB31, and PC0 to PC31 integrate a programmable pull-up resistor of 100 k $\Omega$ . Programming of this pull-up resistor is performed independently for each I/O line through the PIO Controllers.

After reset, all the I/O lines default as inputs with pull-up resistors enabled, except those which are multiplexed with the External Bus Interface signals that require to be enabled as Peripherals at reset. This is explicitly indicated in the column "Reset State" of the PIO Controller multiplexing tables.

## 6.5 Shutdown Logic Pins

The SHDN pin is an output only, driven by Shutdown Controller.

The pin WKUP is an input only. It can accept voltages only between 0V and VDDBU.

## 7. Processor and Architecture

### 7.1 ARM926EJ-S Processor

- RISC Processor Based on ARM v5TEJ Architecture with Jazelle technology for Java acceleration
- Two Instruction Sets
  - ARM High-performance 32-bit Instruction Set
  - Thumb High Code Density 16-bit Instruction Set
- DSP Instruction Extensions
- 5-Stage Pipeline Architecture:
  - Instruction Fetch (F)
  - Instruction Decode (D)
  - Execute (E)
  - Data Memory (M)
  - Register Write (W)
- 16 Kbyte Data Cache, 16 Kbyte Instruction Cache
  - Virtually-addressed 4-way Associative Cache
  - Eight words per line
  - Write-through and Write-back Operation
  - Pseudo-random or Round-robin Replacement
- Write Buffer
  - Main Write Buffer with 16-word Data Buffer and 4-address Buffer
  - DCache Write-back Buffer with 8-word Entries and a Single Address Entry
  - Software Control Drain
- Standard ARM v4 and v5 Memory Management Unit (MMU)
  - Access Permission for Sections
  - Access Permission for large pages and small pages can be specified separately for each quarter of the page
  - 16 embedded domains
- Bus Interface Unit (BIU)
  - Arbitrates and Schedules AHB Requests
  - Separate Masters for both instruction and data access providing complete AHB system flexibility
  - Separate Address and Data Buses for both the 32-bit instruction interface and the 32-bit data interface
  - On Address and Data Buses, data can be 8-bit (Bytes), 16-bit (Half-words) or 32-bit (Words)

## 7.2 Debug and Test Features

- Integrated Embedded In-circuit Emulator Real-Time
  - Two real-time Watchpoint Units
  - Two Independent Registers: Debug Control Register and Debug Status Register
  - Test Access Port Accessible through JTAG Protocol
  - Debug Communications Channel
- Debug Unit
  - Two-pin UART
  - Debug Communication Channel Interrupt Handling
  - Chip ID Register
- Embedded Trace Macrocell: ETM9™
  - Medium+ Level Implementation
  - Half-rate Clock Mode
  - Four Pairs of Address Comparators
  - Two Data Comparators
  - Eight Memory Map Decoder Inputs
  - Two 16-bit Counters
  - One 3-stage Sequencer
  - One 45-byte FIFO
- IEEE1149.1 JTAG Boundary-scan on All Digital Pins

## 7.3 Bus Matrix

- Five Masters and Five Slaves handled
  - Handles Requests from the ARM926EJ-S, USB Host Port, LCD Controller and the Peripheral DMA Controller to internal ROM, internal SRAM, EBI, APB, LCD Controller and USB Host Port.
  - Round-Robin Arbitration (three modes supported: no default master, last accessed default master, fixed default master)
  - Burst Breaking with Slot Cycle Limit
- One Address Decoder Provided per Master
  - Three different slaves may be assigned to each decoded memory area: one for internal boot, one for external boot, one after remap.
- Boot Mode Select Option
  - Non-volatile Boot Memory can be Internal or External.
  - Selection is made by BMS pin sampled at reset.
- Remap Command
  - Allows Remapping of an Internal SRAM in Place of the Boot Non-Volatile Memory
  - Allows Handling of Dynamic Exception Vectors

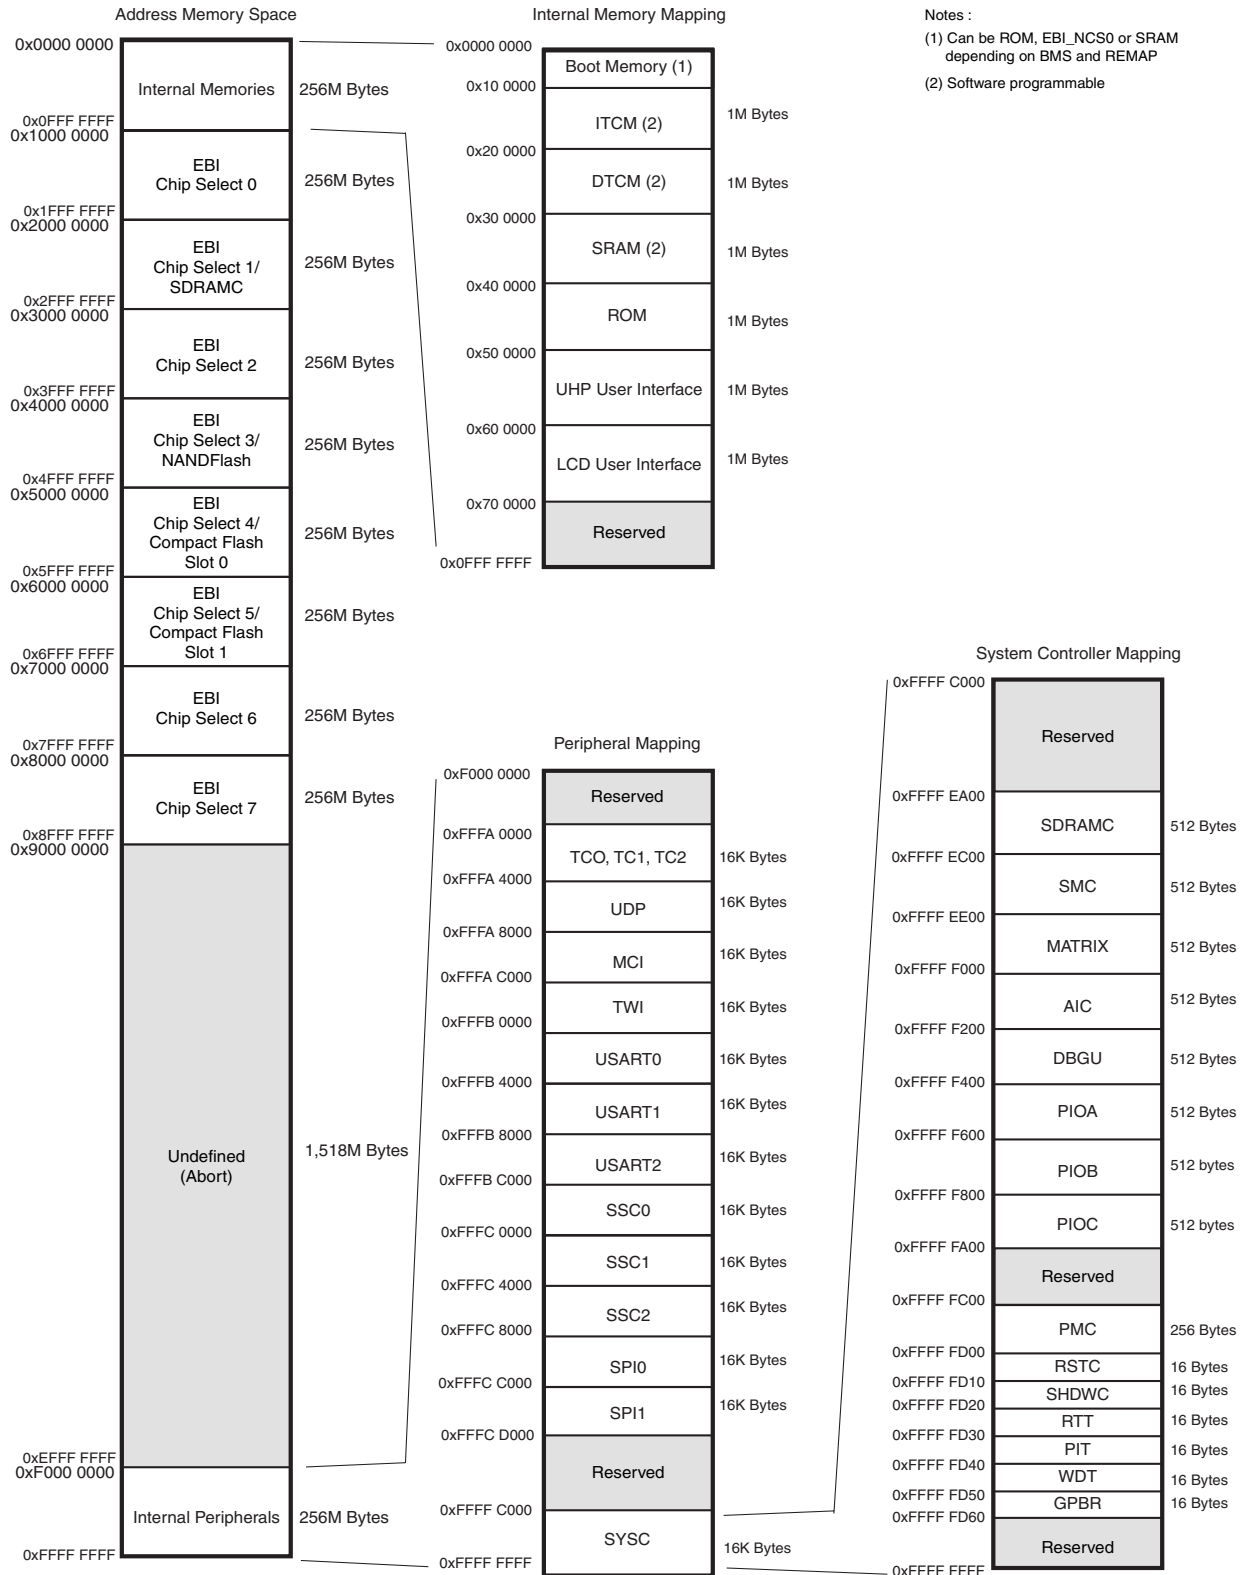

## 7.4 Peripheral DMA Controller

- Transfers from/to peripheral to/from any memory space without intervention of the processor.
- Next Pointer Support, forbids strong real-time constraints on buffer management.

- Nineteen channels
  - Two for each USART
  - Two for the Debug Unit
  - Two for each Serial Synchronous Controller
  - Two for each Serial Peripheral Interface
  - One for the Multimedia Card Interface

# 8. Memories

Figure 8-1. AT91SAM9261 Memory Mapping

A first level of address decoding is performed by the Bus Matrix, i.e., the implementation of the Advanced High performance Bus (AHB) for its Master and Slave interfaces with additional features.

Decoding breaks up the 4 Gbytes of address space into 16 areas of 256 Mbytes. The areas 1 to 8 are directed to the EBI that associates these areas to the external chip selects NCS0 to NCS7. The area 0 is reserved for the addressing of the internal memories, and a second level of decoding provides 1 Mbyte of internal memory area. The area 15 is reserved for the peripherals and provides access to the Advanced Peripheral Bus (APB).

Other areas are unused and performing an access within them provides an abort to the master requesting such an access.

The Bus Matrix manages five Masters and five Slaves.

Each Master has its own bus and its own decoder, thus allowing a different memory mapping per Master.

Regarding Master 0 and Master 1 (ARM926™ Instruction and Data), three different Slaves are assigned to the memory space decoded at address 0x0: one for internal boot, one for external boot, one after remap. Refer to [Table 8-3](#) for details.

**Table 8-1.** List of Bus Matrix Masters

Master 0	ARM926 Instruction
Master 1	ARM926 Data
Master 2	PDC
Master 3	LCD Controller
Master 4	USB Host

Each Slave has its own arbiter, thus allowing a different arbitration per Slave.

**Table 8-2.** List of Bus Matrix Slaves

Slave 0	Internal SRAM
Slave 1	Internal ROM
Slave 2	LCD Controller and USB Host Port Interfaces
Slave 3	External Bus Interface
Slave 4	Internal Peripherals

## 8.1 Embedded Memories

- 32 KB ROM
  - Single Cycle Access at full bus speed
- 160 KB Fast SRAM
  - Single Cycle Access at full bus speed
  - Supports ARM926EJ-S TCM interface at full processor speed

### 8.1.1 Internal Memory Mapping

Table 8-3 summarizes the Internal Memory Mapping for each Master, depending on the Remap status and the BMS state at reset.

**Table 8-3.** Internal Memory Mapping

Address	Master 0: ARM926 Instruction			Master 1: ARM926 Data		
	REMAP(RCB0) = 0		REMAP (RCB0) = 1	REMAP (RCB1) = 0		REMAP (RCB1) = 1
	BMS = 1	BMS = 0		BMS = 1	BMS = 0	
0x0000 0000	Int. ROM	EBI NCS0 <sup>(1)</sup>	Int. RAM C	Int. ROM	EBI NCS0 <sup>(1)</sup>	Int. RAM C

Note: 1. EBI NCS0 is to be connected to a 16-bit non-volatile memory. The access configuration is defined by the reset state of SMC Setup, SMC Pulse, SMC Cycle and SMC Mode CS0 registers.

#### 8.1.1.1 Internal SRAM

The AT91SAM9261 embeds a high-speed 160 Kbyte SRAM. This Internal SRAM is split into three areas. Its Memory Mapping is detailed in Table 8-3 above.

- Internal SRAM A is the ARM926EJ-S Instruction TCM and the user can map this SRAM block anywhere in the ARM926 instruction memory space using CP15 instructions. This SRAM block is also accessible by the ARM926 Data Master and by the AHB Masters through the AHB bus at address 0x0010 0000.
- Internal SRAM B is the ARM926EJ-S Data TCM and the user can map this SRAM block anywhere in the ARM926 data memory space using CP15 instructions. This SRAM block is also accessible by the ARM926 Data Master and by the AHB Masters through the AHB bus at address 0x0020 0000.
- Internal SRAM C is only accessible by all the AHB Masters.  
After reset and until the Remap Command is performed, this SRAM block is accessible through the AHB bus at address 0x0030 0000 by all the AHB Masters.  
After Remap, this SRAM block also becomes accessible through the AHB bus at address 0x0 by the ARM926 Instruction and the ARM926 Data Masters.

Within the 160 Kbyte SRAM size available, the amount of memory assigned to each block is software programmable as a multiple of 16 Kbytes according to Table 8-4. This table provides the size of the Internal SRAM C according to the size of the Internal SRAM A and the Internal SRAM B.

**Table 8-4.** Internal SRAM Block Size

Internal SRAM C		Internal SRAM A (ITCM)			
		0	16 Kbytes	32 Kbytes	64 Kbytes
Internal SRAM B (DCTM)	0	160 Kbytes	144 Kbytes	128 Kbytes	96 Kbytes
	16 Kbytes	144 Kbytes	128 Kbytes	112 Kbytes	80 Kbytes
	32 Kbytes	128 Kbytes	112 Kbytes	96 Kbytes	64 Kbytes
	64 Kbytes	96 Kbytes	80 Kbytes	64 Kbytes	32 Kbytes

Note that among the ten 16 Kbyte blocks making up the Internal SRAM, two are permanently assigned to Internal SRAM C.

At reset, the whole memory (160 Kbytes) is assigned to Internal SRAM C.

The memory blocks assigned to SRAM A, SRAM B and SRAM C areas are not contiguous and when the user dynamically changes the Internal SRAM configuration, the new 16 Kbyte block organization may affect the previous configuration from a software point of view.

Table 8-5 illustrates different configurations and the related 16 Kbyte blocks (RB0 to RB9) assignments.

**Table 8-5.** 16 Kbyte Block Allocation

Decoded Area	Address	Configuration Examples and Related 16 Kbyte Block Assignments			
		ITCM = 0 Kbyte DTCM = 0 Kbyte AHB = 160 Kbytes <sup>(1)</sup>	ITCM = 64 Kbytes DTCM = 64 Kbytes AHB = 32 Kbytes	ITCM = 32 Kbytes DTCM = 64 Kbytes AHB = 64 Kbytes	ITCM = 32 Kbytes DTCM = 16 Kbytes AHB = 112 Kbytes
Internal SRAM A (ITCM)	0x0010 0000		RB3	RB3	RB3
	0x0010 4000		RB2	RB2	RB2
	0x0010 8000		RB1		
	0x0010 C000		RB0		
Internal SRAM B (DTCM)	0x0020 0000		RB7	RB7	RB7
	0x0020 4000		RB6	RB6	
	0x0020 8000		RB5	RB5	
	0x0020 C000		RB4	RB4	
Internal SRAM C (AHB)	0x0030 0000	RB9	RB9	RB9	RB9
	0x0030 4000	RB8	RB8	RB8	RB8
	0x0030 8000	RB7		RB1	RB6
	0x0030 C000	RB6		RB0	RB5
	0x0031 0000	RB5			RB4
	0x0031 4000	RB4			RB1
	0x0031 8000	RB3			RB0
	0x0031 C000	RB2			
	0x0032 0000	RB1			
	0x0032 4000	RB0			

Note: 1. Configuration after reset.

### 8.1.1.2 Internal ROM

The AT91SAM9261 integrates a 32 Kbyte Internal ROM mapped at address 0x0040 0000. It is also accessible at address 0x0 after reset and before remap if the BMS is tied high during reset.

### 8.1.1.3 USB Host Port

The AT91SAM9261 integrates a USB Host Port Open Host Controller Interface (OHCI). The registers of this interface are directly accessible on the AHB Bus and are mapped like a standard internal memory at address 0x0050 0000.

### 8.1.1.4 LCD Controller

The AT91SAM9261 integrates an LCD Controller. The interface is directly accessible on the AHB Bus and is mapped like a standard internal memory at address 0x0060 0000.

## 8.1.2 Boot Strategies

The system always boots at address 0x0. To ensure a maximum number of possibilities for boot, the memory layout can be configured with two parameters.

REMAP allows the user to lay out the first internal SRAM bank to 0x0 to ease development. This is done by software once the system has booted for each Master of the Bus Matrix. Refer to the Bus Matrix Section for more details.

When REMAP = 0, BMS allows the user to lay out to 0x0, at his convenience, the ROM or an external memory. This is done via hardware at reset.

Note: Memory blocks not affected by these parameters can always be seen at their specified base addresses. See the complete memory map presented in [Figure 8-1 on page 16](#).

The AT91SAM9261 Bus Matrix manages a boot memory that depends on the level on the BMS pin at reset. The internal memory area mapped between address 0x0 and 0x000F FFFF is reserved for this purpose.

If BMS is detected at 1, the boot memory is the embedded ROM.

If BMS is detected at 0, the boot memory is the memory connected on the Chip Select 0 of the External Bus Interface.

### 8.1.2.1 BMS = 1, Boot on Embedded ROM

The system boots using the Boot Program.

- DataFlash Boot
  - Downloads and runs an application from SPI DataFlash into internal SRAM
  - Downloaded code size from SPI DataFlash depends on embedded SRAM size
  - Automatic detection of valid application
  - SPI DataFlash connected to SPI NPCS0
- NANDFlash Boot
- Boot Uploader in case no valid program is detected in external SPI DataFlash
  - Small monitor functionalities (read/write/run) interface with SAM-BA™ application
  - Automatic detection of the communication link
    - Serial communication on a DBGU (XModem protocol)
    - USB Device Port (CDC Protocol)

### 8.1.2.2 BMS = 0, Boot on External Memory

- Boot on slow clock (32,768 Hz)
- Boot with the default configuration for the Static Memory Controller, byte select mode, 16-bit data bus, Read/Write controlled by Chip Select, allows boot on 16-bit non-volatile memory.

The customer-programmed software must perform a complete configuration.

To speed up the boot sequence when booting at 32 kHz EBI CS0 (BMS=0), the user must take the following steps:

1. Program the PMC (main oscillator enable or bypass mode).
2. Program and start the PLL.

3. Reprogram the SMC setup, cycle, hold, mode timings registers for CS0 to adapt them to the new clock
4. Switch the main clock to the new value.

### 8.1.3 ETM™ Memories

The eight ETM9 Medium+ memory map decoder inputs are connected to custom address decoders and the resulting memory mapping is summarized in [Table 8-6](#).

**Table 8-6.** ETM9 Memory Mapping

Product Resource	Area	Access Type	Start Address	End Address
SRAM	Internal	Data	0x0000 0000	0x002F FFFF
SRAM	Internal	Fetch	0x0000 0000	0x002F FFFF
ROM	Internal	Data	0x0040 0000	0x004F FFFF
ROM	Internal	Fetch	0x0040 0000	0x004F FFFF
External Bus Interface	External	Data	0x1000 0000	0x8FFF FFFF
External Bus Interface	External	Fetch	0x1000 0000	0x8FFF FFFF
User Peripherals	Internal	Data	0xF000 0000	0xFFFF BFFF
System Peripherals	Internal	Data	0xFFFF C000	0xFFFF FFFF

### 8.2 External Memories

The external memories are accessed through the External Bus Interface (Bus Matrix Slave 3).

Refer to the memory map in [Figure 8-1 on page 16](#).

## 9. System Controller

The System Controller manages all vital blocks of the microcontroller: interrupts, clocks, power, time, debug and reset.

The System Peripherals are all mapped within the highest 6 Kbytes of address space, between addresses 0xFFFF EA00 and 0xFFFF FFFF. Each peripheral has an address space of 256 or 512 Bytes, representing 64 or 128 registers.

[Figure 9-1 on page 23](#) shows the System Controller block diagram.

[Figure 8-1 on page 16](#) shows the mapping of the User Interfaces of the System Controller peripherals.

## 9.1 Block Diagram

Figure 9-1. System Controller Block Diagram

## 9.2 Reset Controller

- Based on two Power-on-Reset cells
- Status of the last reset
  - Either cold reset, first reset, soft reset, user reset, watchdog reset, wake-up reset
- Controls the internal resets and the NRST pin output

## 9.3 Shutdown Controller

- Shutdown and Wake-up logic:
  - Software programmable assertion of the SHDN pin
  - Deassertion Programmable on a WKUP pin level change or on alarm

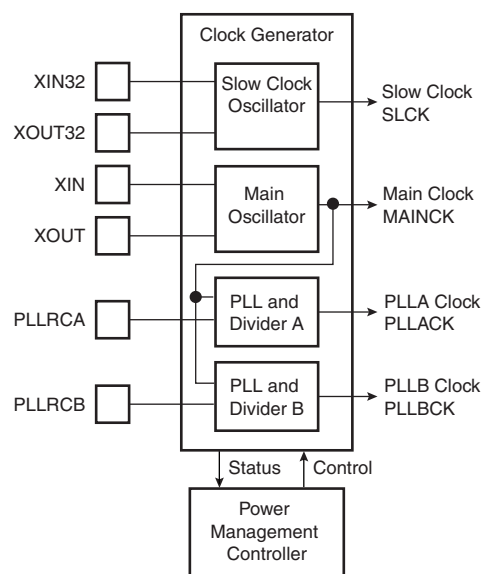

## 9.4 General-purpose Backup Registers

- Four 32-bit general-purpose backup registers

## 9.5 Clock Generator

- Embeds the Low-power 32768 Hz Slow Clock Oscillator
  - Provides the permanent Slow Clock to the system
- Embeds the Main Oscillator
  - Oscillator bypass feature
  - Supports 3 to 20 MHz crystals
- Embeds Two PLLs
  - Outputs 80 to 240 MHz clocks
  - Integrates an input divider to increase output accuracy
  - 1 MHz minimum input frequency
- Provides SLCK, MAINCK, PLLACK and PLLBCK.

**Figure 9-2.** Clock Generator Block Diagram

## 9.6 Power Management Controller

- The Power Management Controller provides:
  - the Processor Clock PCK
  - the Master Clock MCK
  - the USB Clock USBCK (HCK0)
  - the LCD Controller Clock LCDCK (HCK1)
  - up to thirty peripheral clocks
  - four programmable clock outputs: PCK0 to PCK3

**Figure 9-3.** Power Management Controller Block Diagram

## 9.7 Periodic Interval Timer

- Includes a 20-bit Periodic Counter with less than 1  $\mu$ s accuracy
- Includes a 12-bit Interval Overlay Counter
- Real time OS or Linux®/WindowsCE® compliant tick generator

## 9.8 Watchdog Timer

- 12-bit key-protected only-once programmable counter
- Windowed, prevents the processor to be in a dead-lock on the watchdog access

## 9.9 Real-time Timer

- 32-bit Free-running backup counter
- Alarm Register capable to generate a wake-up of the system

## 9.10 Advanced Interrupt Controller

- Controls the interrupt lines (nIRQ and nFIQ) of an ARM Processor
- Thirty-two individually maskable and vectored interrupt sources
  - Source 0 is reserved for the Fast Interrupt Input (FIQ)
  - Source 1 is reserved for system peripherals (PIT, RTT, PMC, DBGU, etc.)
  - Source 2 to Source 31 control up to thirty embedded peripheral interrupts or external interrupts
  - Programmable edge-triggered or level-sensitive internal sources
  - Programmable positive/negative edge-triggered or high/low level-sensitive
- Four External Sources
- 8-level Priority Controller
  - Drives the normal interrupt of the processor
  - Handles priority of the interrupt sources 1 to 31
  - Higher priority interrupts can be served during service of lower priority interrupt
- Vectoring
  - Optimizes Interrupt Service Routine Branch and Execution
  - One 32-bit Vector Register per interrupt source
  - Interrupt Vector Register reads the corresponding current Interrupt Vector
- Protect Mode
  - Easy debugging by preventing automatic operations when protect mode is enabled
- Fast Forcing
  - Permits redirecting any normal interrupt source on the Fast Interrupt of the processor
- General Interrupt Mask
  - Provides processor synchronization on events without triggering an interrupt

## 9.11 Debug Unit

- Composed of four functions
  - Two-pin UART
  - Debug Communication Channel (DCC) support
  - Chip ID Registers
  - ICE Access Prevention
- Two-pin UART
  - Implemented features are 100% compatible with the standard Atmel USART
  - Independent receiver and transmitter with a common programmable Baud Rate Generator
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Support for two PDC channels with connection to receiver and transmitter
- Debug Communication Channel Support

- Offers visibility of COMMRX and COMMTX signals from the ARM Processor
- Chip ID Registers
  - Identification of the device revision, sizes of the embedded memories, set of peripherals
- ICE Access prevention
  - Enables software to prevent system access through the ARM Processor's ICE
  - Prevention is made by asserting the NTRST line of the ARM Processor's ICE

## 9.12 PIO Controllers

- Three PIO Controllers, each controlling up to 32 programmable I/O Lines
  - PIOA has 32 I/O Lines
  - PIOB has 32 I/O Lines
  - PIOC has 32 I/O Lines
- Fully programmable through Set/Clear Registers
- Multiplexing of two peripheral functions per I/O Line
- For each I/O Line (whether assigned to a peripheral or used as general-purpose I/O)
  - Input change interrupt
  - Glitch filter
  - Multi-drive option enables driving in open drain
  - Programmable pull up on each I/O line
  - Pin data status register, supplies visibility of the level on the pin at any time
- Synchronous output, provides Set and Clear of several I/O lines in a single write

## 10. Peripherals

### 10.1 User Interface

The User Peripherals are mapped in the upper 256 Mbytes of the address space between the addresses 0xFFFA 0000 and 0xFFFC FFFF. Each User Peripheral is allocated 16 Kbytes of address space.

A complete memory map is presented in [Figure 8-1 on page 16](#).

### 10.2 Peripheral Identifiers

[Table 10-1](#) defines the Peripheral Identifiers of the AT91SAM9261. A peripheral identifier is required for the control of the peripheral interrupt with the Advanced Interrupt Controller and for the control of the peripheral clock with the Power Management Controller.

**Table 10-1.** Peripheral Identifiers

Peripheral ID	Peripheral Mnemonic	Peripheral Name	External Interrupt
0	AIC	Advanced Interrupt Controller	FIQ
1	SYSIRQ	System Interrupt	
2	PIOA	Parallel I/O Controller A	
3	PIOB	Parallel I/O Controller B	
4	PIOC	Parallel I/O Controller C	
5	-	Reserved	
6	US0	USART 0	
7	US1	USART 1	
8	US2	USART 2	
9	MCI	Multimedia Card Interface	
10	UDP	USB Device Port	
11	TWI	Two-Wire Interface	
12	SPI0	Serial Peripheral Interface 0	
13	SPI1	Serial Peripheral Interface 1	
14	SSC0	Synchronous Serial Controller 0	
15	SSC1	Synchronous Serial Controller 1	
16	SSC2	Synchronous Serial Controller 2	
17	TC0	Timer/Counter 0	
18	TC1	Timer/Counter 1	
19	TC2	Timer/Counter 2	
20	UHP	USB Host Port	
21	LCDC	LCD Controller	
22 - 28	-	Reserved	
29	AIC	Advanced Interrupt Controller	IRQ0
30	AIC	Advanced Interrupt Controller	IRQ1
31	AIC	Advanced Interrupt Controller	IRQ2

Note: Setting AIC, SYSIRQ, UHP, LCDC and IRQ0 to IRQ2 bits in the clock set/clear registers of the PMC has no effect.

## 10.3 Peripheral Multiplexing on PIO Lines

The AT91SAM9261 features three PIO controllers, PIOA, PIOB and PIOC, that multiplex the I/O lines of the peripheral set.

Each PIO Controller controls up to thirty-two lines. Each line can be assigned to one of two peripheral functions, A or B. [Table 10-2 on page 31](#), [Table 10-3 on page 32](#) and [Table 10-4 on page 33](#) define how the I/O lines of the peripherals A and B are multiplexed on the PIO Controllers. The two columns “Function” and “Comments” have been inserted for the user’s own comments; they may be used to track how pins are defined in an application.

Note that some output only peripheral functions might be duplicated within the tables.

The column “Reset State” indicates whether the PIO line resets in I/O mode or in peripheral mode. If I/O is mentioned, the PIO line resets in input with the pull-up enabled, so that the device is maintained in a static state as soon as the reset is released. As a result, the bit corresponding to the PIO line in the register PIO\_PSR (Peripheral Status Register) resets low.

If a signal name is mentioned in the “Reset State” column, the PIO line is assigned to this function and the corresponding bit in PIO\_PSR resets high. This is the case of pins controlling memories, in particular the address lines, which require the pin to be driven as soon as the reset is released. Note that the pull-up resistor is also enabled in this case.

### 10.3.1 Resource Multiplexing

#### 10.3.1.1 LCD Controller

The LCD Controller can interface with several LCD panels. It supports 4, 8 or 16 bit-per-pixel without any limitation. Interfacing 24 bit-per-pixel TFTs panel prevents using the SSC0 and the chip select line 0 of the SPI1.

16 bit-per-pixel TFT panels are interfaced through peripheral B functions, as color data is output on LCDD3 to LCDD7, LCDD11 to LCDD15 and LCDD19 to LCDD23. Intensity bit is output on LCDD2, LCDD10 and LCDD18. Using the peripheral B does not prevent using the SSC0 and the SPI1 lines.

#### 10.3.1.2 ETM

Using the ETM prevents:

- using the USART1 and USART2 control signals, in particular the SCK lines which are required to use the USART as ISO7816 and the RTS and CTS to handle hardware handshaking on the serial lines. In case the ETM and an ISO7816 connection are both required, the USART0 has to be used as a Smart Card interface.
- using the SSC1
- addressing a static memory of more than 8 Mbytes, which requires the A23 and A24 address lines
- using the chip select lines 1 to 3 of SPI0 and SPI1

#### 10.3.1.3 EBI

If not required, the NWAIT function (external wait request) can be deactivated by software, allowing this pin to be used as a PIO.

#### 10.3.1.4 *32-bit Data Bus*

Using a 32-bit Data Bus prevents:

- using the three Timer Counter channels' outputs and trigger inputs
- using the SSC2

#### 10.3.1.5 *NAND Flash Interface*

Using the NAND Flash interface prevents:

- using NCS3, NCS6 and NCS7 to access other parallel devices

#### 10.3.1.6 *Compact Flash Interface*

Using the CompactFlash interface prevents:

- using NCS4 and/or NCS5 to access other parallel devices

#### 10.3.1.7 *SPI0 and the MultiMedia Card Interface*

As the DataFlash Card is compatible with the SDCard, it is useful to multiplex SPI and MCI. Here, the SPI0 signal is multiplexed with the MCI.

#### 10.3.1.8 *USARTs*

- Using the USART1 and USART2 control signals prevents using the ETM.
- Alternatively, using USART0 with its control signals prevents using some clock outputs and interrupt lines.

#### 10.3.1.9 *Clock Outputs*

- Using the clock outputs multiplexed with the PIO A prevents using the Debug Unit and/or the Two Wire Interface.
- Alternatively, using the second implementation of the clock outputs prevents using the LCD Controller Interface and/or USART0.

#### 10.3.1.10 *Interrupt Lines*

- Using FIQ prevents using the USART0 control signals.
- Using IRQ0 prevents using the NWAIT EBI signal.
- Using the IRQ1 and/or IRQ2 prevents using the SPI1.

## 10.3.2 PIO Controller A Multiplexing

**Table 10-2.** Multiplexing on PIO Controller A

PIO Controller A					Application Usage		
I/O Line	Peripheral A	Peripheral B	Comments	Reset State	Power Supply	Function	Comments
PA0	SPI0_MISO	MCDA0		I/O	VDDIOP		
PA1	SPI0_MOSI	MCCDA		I/O	VDDIOP

### 10.3.5 System Interrupt

The System Interrupt in Source 1 is the wired-OR of the interrupt signals coming from:

- the SDRAM Controller
- the Debug Unit
- the Periodic Interval Timer
- the Real-Time Timer
- the Watchdog Timer
- the Reset Controller
- the Power Management Controller

The clock of these peripherals cannot be deactivated and Peripheral ID 1 can only be used within the Advanced Interrupt Controller.

### 10.3.6 External Interrupts

All external interrupt signals, i.e., the Fast Interrupt signal FIQ or the Interrupt signals IRQ0 to IRQ2, use a dedicated Peripheral ID. However, there is no clock control associated with these peripheral IDs.

## 10.4 External Bus Interface

- Integrates two External Memory Controllers:
  - Static Memory Controller
  - SDRAM Controller
- Additional logic for NAND Flash and CompactFlash support
  - NAND Flash support: 8-bit as well as 16-bit devices are supported
  - CompactFlash support: all modes (Attribute Memory, Common Memory, I/O, True IDE) are supported but the signals -IOIS16 (I/O and True IDE modes) and -ATA SEL (True IDE mode) are not handled.
- Optimized External Bus
  - 16- or 32-bit Data Bus
  - Up to 26-bit Address Bus, up to 64 Mbytes addressable
  - Eight Chip Selects, each reserved to one of the eight Memory Areas
  - Optimized pin multiplexing to reduce latencies on External Memories
- Configurable Chip Select Assignment Managed by EBI\_CSA Register located in the MATRIX user interface
  - Static Memory Controller on NCS0
  - SDRAM Controller or Static Memory Controller on NCS1
  - Static Memory Controller on NCS2
  - Static Memory Controller on NCS3, Optional NAND Flash Support
  - Static Memory Controller on NCS4 - NCS5, Optional CompactFlash Support
  - Static Memory Controller on NCS6 - NCS7

## 10.5 Static Memory Controller

- External memory mapping, 256 Mbyte address space per Chip Select Line
- Up to Eight Chip Select Lines
- 8-, 16- or 32-bit Data Bus
- Multiple Access Modes supported
  - Byte Write or Byte Select Lines
  - Asynchronous read in Page Mode supported (4- up to 32-byte page size)
- Multiple device adaptability
  - Compliant with LCD Module
  - Control signal programmable setup, pulse and hold time for each Memory Bank
- Multiple Wait State Management
  - Programmable Wait State Generation
  - External Wait Request
  - Programmable Data Float Time
- Slow Clock Mode Supported

## 10.6 SDRAM Controller

- Supported Devices
  - Standard and Low Power SDRAM (Mobile SDRAM)
- Numerous configurations supported
  - 2K, 4K, 8K Row Address Memory Parts
  - SDRAM with two or four Internal Banks
  - SDRAM with 16- or 32-bit Data Path
- Programming Facilities
  - Word, half-word, byte access
  - Automatic page break when Memory Boundary has been reached
  - Multibank Ping-pong Access
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
- Energy-saving Capabilities
  - Self-refresh, power down and deep power down modes supported
- Error detection
  - Refresh Error Interrupt
- SDRAM Power-up Initialization by software
- CAS Latency of 1, 2 and 3 supported
- Auto Precharge Command not used

## 10.7 Serial Peripheral Interface

- Supports communication with serial external devices
  - Four chip selects with external decoder support allow communication with up to fifteen peripherals
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD Controllers, CAN Controllers and Sensors
  - External co-processors
- Master or slave serial peripheral bus interface
  - 8- to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delays between consecutive transfers and between clock and data per chip select
  - Programmable delay between consecutive transfers
  - Selectable mode fault detection
- Very fast transfers supported
  - Transfers with baud rates up to MCK
  - The chip select line may be left active to speed up transfers on the same device

## 10.8 Two-wire Interface

- Compatibility with standard two-wire serial memory
- One, two or three bytes for slave address
- Sequential read/write operations

## 10.9 USART

- Programmable Baud Rate Generator
- 5- to 9-bit full-duplex synchronous or asynchronous serial communications
  - 1, 1.5 or 2 stop bits in Asynchronous Mode or 1 or 2 stop bits in Synchronous Mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - MSB- or LSB-first
  - Optional break generation and detection
  - By-8 or by-16 over-sampling receiver frequency
  - Hardware handshaking RTS-CTS
  - Receiver time-out and transmitter timeguard
  - Optional Multi-drop Mode with address generation and detection
  - Optional Manchester Encoding
- RS485 with driver control signal
- ISO7816, T = 0 or T = 1 Protocols for interfacing with smart cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA modulation and demodulation

- Communication at up to 115.2 Kbps
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo

## 10.10 Synchronous Serial Controller

- Provides serial synchronous communication links used in audio and telecom applications (with CODECs in Master or Slave Modes, I<sup>2</sup>S, TDM Buses, Magnetic Card Reader and more).
- Contains an independent receiver and transmitter and a common clock divider.
- Offers a configurable frame sync and data length.
- Receiver and transmitter can be programmed to start automatically or on detection of different event on the frame sync signal.
- Receiver and transmitter include a data signal, a clock signal and a frame synchronization signal.

## 10.11 Timer Counter

- Three 16-bit Timer Counter Channels
- Wide range of functions including:
  - Frequency Measurement
  - Event Counting
  - Interval Measurement
  - Pulse Generation
  - Delay Timing
  - Pulse Width Modulation
  - Up/down Capabilities
- Each channel is user-configurable and contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multi-purpose input/output signals
- Two global registers that act on all three TC Channels

## 10.12 Multimedia Card Interface

- Compatibility with MultiMedia Card Specification Version 2.2
- Compatibility with SD Memory Card Specification Version 1.0
- Cards clock rate up to Master Clock divided by 2
- Embedded power management to slow down clock rate when not used
- Each MCI has two slots, each supporting
  - One slot for one MultiMedia Card bus (up to 30 cards) or
  - One SD Memory Card
- Support for stream, block and multi-block data read and write

## 10.13 USB

- USB Host Port:
  - Compliance with Open HCI Rev 1.0 specification
  - Compliance with USB V2.0 Full-speed and Low-speed Specification
  - Supports both Low-speed 1.5 Mbps and Full-speed 12 Mbps USB devices
  - Root hub integrated with two downstream USB ports
  - Two embedded USB transceivers
  - No overcurrent detection
  - Supports power management
  - Operates as a master on the Bus Matrix
- USB Device Port:
  - USB V2.0 full-speed compliant, 12 Mbits per second
  - Embedded USB V2.0 full-speed transceiver
  - Embedded dual-port RAM for endpoints
  - Suspend/Resume logic
  - Ping-pong mode (two memory banks) for isochronous and bulk endpoints
  - Six general-purpose endpoints:
    - Endpoint 0: 8 bytes, no ping-pong mode
    - Endpoint 1, Endpoint 2: 64 bytes, ping-pong mode
    - Endpoint 3: 64 bytes, no ping-pong mode
    - Endpoint 4, Endpoint 5: 256 bytes, ping-pong mode
- Embedded pad pull-up configurable via USB\_PUCR Register located in the MATRIX user interface

## 10.14 LCD Controller

- Single and Dual scan color and monochrome passive STN LCD panels supported
- Single scan active TFT LCD panels supported.
- 4-bit single scan, 8-bit single or dual scan, 16-bit dual scan STN interfaces supported
- Up to 24-bit single scan TFT interfaces supported
- Up to 16 gray levels for mono STN and up to 4096 colors for color STN displays
- 1, 2 bits per pixel (palletized), 4 bits per pixel (non-palletized) for mono STN
- 1, 2, 4, 8 bits per pixel (palletized), 16 bits per pixel (non-palletized) for color STN
- 1, 2, 4, 8 bits per pixel (palletized), 16, 24 bits per pixel (non-palletized) for TFT
- Single clock domain architecture
- Resolution supported up to 2048 x 2048

## 11. Package Drawing

Figure 11-1. 217-ball LFBGA Package Drawing

## 12. Ordering Information

**Table 12-1.** AT91SAM9261 Ordering Information

Ordering Code	Package	Package Type	Temperature Operating Range
AT91SAM9261-CJ	BGA217	RoHS-compliant	Industrial -40°C to 85°C

## 13. Revision History

Table 13-1. Revision History

Doc. Rev.	Source	Comments
6062AS		<b>Qualified/Internal:</b> 23-Aug-04
		<b>Date:</b> 02-Jun-05
	CSR 04-370	Change to Additional Embedded Memories in “Features” on page 1. Change to Section 5.2 “Power Consumption” on page 11. Change to Table 8-3 on page 18.
	CSR 04-371	Change to AIC, “Features” on page 1, SMCS signal added to Table 3-1, “Signal Description by Peripheral,” on page 5, Change to Section 10.3.1.5 “NAND Flash Interface” on page 30.
	CSR 04-376	Added NTRST signal to “Block Diagram” on page 4. NTRST signal added to Table 3-1 on page 5. F1 modified in Table 4-1 on page 10. Change to “JTAG Port Pins” on page 11.
	CSR 04-446	Changed ROM access to single cycle in “Features” on page 1 and Section 8.1 “Embedded Memories” on page 17.
	CSR 04-447	Replaced “PDMA” with “PDC” throughout. Replaced “Peripheral DMA” with “Peripheral DMA Controller” throughout.
	CSR 04-461	New pinout for 217-ball LFBGA package, Table 2 updated.
	CSR 04-475	Updated Section 8.1.2 “Boot Program” on page 20.
6062BS		Removed “Embedded Software Services” on page 18.
	CSR 05-023	Changed min voltage level for VDDIOM and VDDIOP to 2.7V throughout. Corrected nominal voltage level for VDDIOP and VDDIOP in Section 5.1 “Power Supplies” on page 11.
	CSR 05-024	Added information on chip select assignment management in Section 10.4 “External Bus Interface” on page 34.
		Added information on configuration management of embedded pad pull-up in Section 10.13 “USB” on page 38.
		Throughout document: All references to SmartMedia removed and replaced by NAND Flash. All signals SMxx changed to NANDxx.
		Throughout document: Package now qualified as RoHS-compliant
		Changed pull-up resistor level to 10 kOhm in Section 6.4 “PIO Controller A, B and C Lines” on page 12.
		Changed typical conditions for VDDCORE to 1.2V in Section 5.2 “Power Consumption” on page 11.
		Corrected BMS state in Table 8-3, “Internal Memory Mapping,” on page 18.
		Corrected BMS reset condition for ROM access in Section 8.1.1.2 “Internal ROM” on page 19.
		<b>Date:</b> 15-Nov-05
6062CS	CSR 05-398	Changed SPI pin names in Figure 2-1, “AT91SAM9261 Block Diagram,” on page 4, Table 3-1, “Signal Description by Peripheral,” on page 5, Table 10-2, “Multiplexing on PIO Controller A,” on page 31, Table 10-3, “Multiplexing on PIO Controller B,” on page 32 and Table 10-4, “Multiplexing on PIO Controller C,” on page 33.
	CSR 05-481	Updated A22 pin in Figure 2-1, “AT91SAM9261 Block Diagram,” on page 4.
	CSR 05-496	Changed value of programmable pull-up resistor in Section 6.4 “PIO Controller A, B and C Lines” on page 12.
	CSR 05-487	Updated Table 12-1, “AT91SAM9261 Ordering Information,” on page 40.

**Table 13-1. Revision History**

Doc. Rev.	Source	Comments	
6062DS		Corrected MIPS and speed on page 1.	
	2292	Added information on EBI NCS0 when BMS = 0 in <a href="#">Table 8-3, "Internal Memory Mapping," on page 18.</a>	
6062ES	2946	Updated information on JTAGSEL in <a href="#">Section 3-1 "Signal Description by Peripheral" on page 5</a> and in <a href="#">Section 6.1 "JTAG Port Pins" on page 11.</a>	
	2475	Reformatted <a href="#">Section 8. "Memories" on page 16.</a> Inserted new <a href="#">Figure 8-1, "AT91SAM9261 Memory Mapping," on page 16</a> to show full product memory mapping.	
	2474	Removed information on Timer Counter clock assignments in <a href="#">Section 10.11 "Timer Counter" on page 37.</a>	
	2480	Inserted new <a href="#">Section 8.1.2 "Boot Strategies" on page 20</a> to replace Boot ROM section.	
6062FS	3068	Changed pin name for ball D9 to SHDN in <a href="#">Table 4-1, "AT91SAM9261 Pinout for 217-ball LFBGA Package (1)," on page 10.</a>	
	3147	Updated information on shutdown pin in <a href="#">Section 6.5 "Shutdown Logic Pins" on page 12.</a>	
	3067	Updated peripheral mnemonics in <a href="#">Figure 8-1, "AT91SAM9261 Memory Mapping," on page 16.</a>	
	3503	Added note to <a href="#">Table 10-1, "Peripheral Identifiers," on page 28.</a>	
6062GS	3660, 3695	Updated VDDOSC, VDDPLL and VDDIOM ranges in "Features", <a href="#">Table 3-1, "Signal Description by Peripheral," on page 5</a> and <a href="#">Section 5.2 "Power Consumption" on page 11.</a>	
	3660	Added ROM to <a href="#">Figure 8-1, "AT91SAM9261 Memory Mapping," on page 16.</a>	
6062HS	3491	Updated <a href="#">Section 9.6 "Power Management Controller" on page 25</a> and <a href="#">Figure 9-3, "Power Management Controller Block Diagram," on page 25.</a>	
		Added <a href="#">Section 11. "Package Drawing" on page 39.</a>	
6062IS		5042	<a href="#">Table 10-4, "Multiplexing on PIO Controller C," on page 33,</a> PCO - PC7 and PC12-PC13 power supplies are VDDIOP <b>not</b> VDDIOM. <a href="#">Table 10-2, "Multiplexing on PIO Controller A," on page 31</a> PA30-PA31 power supplies are VDDIOP <b>not</b> VDDIOM
		5027 rfo	<a href="#">Section 8.1.2 "Boot Strategies",</a> removed sentence pertaining to "remap" <a href="#">Section 8.1.2.1 "BMS = 1, Boot on Embedded ROM",</a> added NANDFlash Boot.
		4965	<a href="#">Section 5.1 "Power Supplies",</a> startup voltage slope requirements for VDDCORE and VDDDBU added.
		4844	<a href="#">Table 10-3, "Multiplexing on PIO Controller B," on page 32,</a> Note added to "PB3" comments
		4835	<a href="#">Figure 9-3, "Power Management Controller Block Diagram," on page 25,</a> in the master memory controller representation, the divider has been updated.
		4241	<a href="#">Table 4-1 on page 10,</a> PCO - PC7, PC8 - PC11, PC12 - PC15 power supplies are VDDIOP <b>not</b> VDDIOM.
6062JS	5250	<a href="#">Section 5.2 "Power Consumption",</a> startup voltage slope requirements for VDDCORE and VDDDBU removed.	
	5248	In <b>Features</b> , on page 2: Required Power Supply updated, 3.0V to 3.6V for VDDOSC and for VDDPLL
