

## Module Driver 6-bit Serial/Parallel, Transmit/Receive

Rev. V1

#### **Features**

- CMOS or LVCMOS Control Logic
- Negative output voltage for GaAs Gate Drive
- 6-bit Serial/Parallel Driver for Attenuator or Phase Shifter Control
- T/R Switch and Amplifier Controls
- · Low Power Dissipation
- Lead-Free 5mm PQFN-40LD Plastic Package
- RoHS\* Compliant and 260°C Reflow Compatible

#### **Description**

The MADR-010410 is a dedicated CMOS driver for multifunction modules such as GaAs based Transmit/Receive Modules. The driver translates CMOS/LVCMOS input controls to negative gate control voltages for GaAs FETs.

The driver includes a 6-bit serial/parallel interface designed to drive digital attenuators and/or phase shifters as well as functionality to switch between transmit and receive channels allowing the ability to enable/disable LNAs or PAs. High speed analog CMOS technology is utilized to achieve low power consumption at moderate to high speeds.

## Ordering Information<sup>1</sup>

Part Number	Package
MADR-010410-000100	Bulk Packaging
MADR-010410-TR0500	500 piece reel

<sup>1.</sup> Reference Application Note M513 for reel size information.

#### **Pin Configuration**

Pin No.	Function	Pin No.	Function
1	B2	21	NC
2	A2	22	NC
3	B1	23	NC
4	A1	24	NC
5	V <sub>EE</sub>	25	GND
6	V <sub>CC</sub>	26	NC
7	S/P	27	P2
8	NC	28	P1
9	NC	29	L2
10	NC	30	L1

#### **Handling Procedures**

Please observe the following precautions to avoid damage:

#### **Static Sensitivity**

Silicon Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Solutions has under development. Performance is based on engineering tests. Specifications are

typical. Mechanical outline has been fixed. Engineering samples

Module Driver 6-bit Serial/Parallel, Transmit/Receive

Rev. V1

## **Functionality**

#### 6-bit Serial/Parallel Driver

The 6-bit serial/parallel driver consists of C1-C6 (shared inputs), S/P (mode control), A1 to A6 (in phase outputs), B1 to B6 (complementary outputs), and SerOut.

The serial control interface (SERIN, CLK, LE, SEROUT) is compatible with SPI protocol. It is activated when S/P is kept high. The 6-bit serial word must be loaded with MSB first. When LE is high, 6-bit data in the serial input register will be transferred to complementary An and Bn outputs. CLK will be masked to prevent data transition during output loading. SEROUT is the SERIN delayed by 6 clock cycles.

The parallel mode is enabled when S/P is set to low. In the parallel mode, the outputs are controlled by the parallel control inputs (C1 to C6) directly.

#### T/R Control

The A7 and B7 outputs are designed to drive the SP2T switch(es) in the T/R module. which switch the T/R module between transmit and receive modes.

The combination of TR and Enable inputs will be able to turn on/off the T/R module receive path LNAs and transmit path PAs. Inside L and P outputs are open-drain NMOS FETs. When they are turned on, they will pull down the gate of the GaAs FETs in the amplifiers to shut them down. See Figure 1 for the application circuit.

**Mode Truth Table** 

S/P	LE	Mode
1	×	Serial
0	N/A	Direct Parallel

#### **Parallel Mode Truth Table**

INPUTs	OUTPUTS		
C1-C6	A1-A6	B1-B6	
0	V <sub>EE</sub>	GND	
1	GND	V <sub>EE</sub>	

### T/R Logic Truth Table

INPU	TS	OUTPUTS			
Enable	TR	A7	В7	L1, L2	P1, P2
0	1	GND	$V_{EE}$	Hi Z	Hi Z
0	0	V <sub>EE</sub>	GND	Hi Z	Hi Z
1	1	GND	V <sub>EE</sub>	Hi Z	Low
1	0	V <sub>EE</sub>	GND	Low	Hi Z

Where:

"Low" means that the NMOS FET is on (pulls the gate to approximately  $V_{\text{EE}} + 0.2V$ ).

"Hi Z" means that the open-drain NMOS FET is shut down and shows a high impedance.

PRELIMINARY: Data Sheets contain information regarding a product M/A-COM Technology Solutions has under development. Performance is based on engineering tests. Specifications are typical. Mechanical outline has been fixed. Engineering samples and one of the containing the containing tests.

Commitment to produce in volume is not d
