# Distributed Amplifier 30 kHz-40 GHz

#### Features

- 15 dB Gain
- 22.5 dBm P1dB at 22 GHz
- 4.5 dB Noise Figure at 26 GHz
- Unconditional Stability over Temperature Range
- 100% On-Wafer RF, DC and Output Power Testing
- 100% Visual Inspection to MIL-STD-883 Method 2010
- RoHS\* Compliant and 260°C Reflow Compatible

### Description

M/A-COM Tech's 30 kHz - 40 GHz GaAs MMIC distributed amplifier has a gain of 15 dB with a 4.5 dB noise figure at 26 GHz. This MMIC uses M/A-GaAs PHEMT device model COM Tech's technology, and is based upon electron beam lithography to ensure high repeatability and uniformity. The chip has surface passivation to protect and provide a rugged part with backside via holes and gold metallization to allow either a conductive epoxy or eutectic solder die attach process. This device is well suited for microwave, millimeter-wave, military, wideband and instrumentation applications.

### **Ordering Information**

Part Number	Package
XD1008-BD-000V	"V" - vacuum release gel paks
XD1008-BD-EV1	evaluation module

# Chip Device Layout

#### Absolute Maximum Ratings<sup>1</sup>

Parameter	Min.	Max.
Supply Voltage (Vd)		+10.0 V
Supply Current (Id)		340 mA
Gate Bias Voltage (Vg1)	-9.5 V	
Gate Current (Ig1)	-38 mA	+1 mA
Gate Bias Voltage (Vg2)	-3.5 V	+4.0 V
Gate Current (Ig2)	-20 mA	
CW Input Power (Pin)		17 dBm
Storage Temperature (Tstg)	-65 °C	+165 °C
Operating Temperature (Ta)	-55 °C	
Channel Temperature (Tch)		+150 °C

(1) Absolute maximum ratings for continuous operation unless otherwise noted.

### **Bias Settings**

Parameter	Units	Min.	Тур.	Max.	Function
Drain Current (Id), V=7 V, VG1=-2.5 V*, VG2=open circuit	mA	9.0	-		
Drain Current (Id), V=4 V, VG1=-2.5 V*, VG2=open circuit	mA	DC	2.0		
Drain Voltage (Vd)	V	-	15.0		Supply drain current to device
Gate Bias (Vg1)	V	10.0	13.5		Adjusted to set drain current
Gate Bias (Vg2)	V	-	+3.0		Adjusted for gain control

#### MTTF

These numbers were calculated based upon accelerated life test information received from the fabricating foundry and extensive thermal modeling/finite element analysis done at Mimix Broadband. The values shown here are only to be used as a guideline against the end application requirements and only represent reliability information under one bias condition. Ultimately bias conditions and resulting power dissipation along with the practical aspects, i.e. thermal material stack-up, attach method of die placement are the key parts in determining overall reliability for a specific application, see previous pages. If the data shown below does not meet your reliability requirements or if the bias conditions are not within your operating limits please contact technical sales for additional information.

# Distributed Amplifier 30 kHz-40 GHz

**App Note [1] Biasing -** The detector diode can be used to measure output power over a broad bandwidth. The detector diode is biased through the PA drain supply and the output voltage is measured at VDET with a high impedance voltage measurement device. A reference diode is also included which may be used to compensate for temperature and manufacturing process variation. The reference diode is biased through pin VDR with the same voltage as the PA drain supply and the voltage difference Vdelta = VDET – VREF is used to measure output power with temperature and manufacturing process compensation.

### **Biasing Schematic**

#### **Handling Procedures**

Please observe the following precautions to avoid damage:

### **Static Sensitivity**

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 2 devices.
