INTEGRATED POWER FUNCTIONS

600V/30A low-loss CSTBT inverter bridge for three phase DC-to-AC power conversion

INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

- For P-side : Drive circuit, High voltage high-speed level shifting, Control supply under-voltage (UV) protection.
- For N-side : Drive circuit, Control supply under-voltage protection (UV), Short circuit protection (SC).
- Fault signaling : Corresponding to a SC fault (N-side IGBT), a UV fault (N-side supply).
- Input interface : 3~5V line (High Active).
- UL Recognized : Yellow Card No. E80276

APPLICATION

AC100V~200V three-phase inverter drive for small power motor control.

Fig. 6 EXTERNAL PART OF THE DIIPIM PROTECTION CIRCUIT

Note1: In the recommended external protection circuit, please select the RC time constant in the range 1.5~2.0μs.
2: To prevent erroneous protection operation, the wiring of A, B, C should be as short as possible.

Short Circuit Protective Function (SC) :
SC protection is achieved by sensing the N-side DC-Bus current (through the external shunt resistor) after allowing a suitable filtering time (defined by the RC circuit). When the sensed shunt voltage exceeds the SC trip-level, all the N-side IGBTs are turned OFF and a fault signal (Fo) is output. Since the SC fault may be repetitive, it is recommended to stop the system when the Fo signal is received and check the fault.

The contacting thermal resistance between case and heat sink (R_{th(c-f)}) is determined by the thickness and the thermal conductivity of the applied grease.

For reference, R_{th(c-f)} (per 1/6 module) is about 0.3°C/W when the grease thickness is 20μm and the thermal conductivity is 1.0W/mK.

5: Fault signal is asserted only corresponding to a SC or a UV failure at N-side, and the F_O pulse width is different for each failure modes. For SC failure, F_O output is with a fixed width of 40μs(min), but for UV failure, F_O outputs continuously during the whole UV period, however, the minimum F_O pulse width is 40μs(min) for very short UV period less than 40μs.

[A] Short-Circuit Protection (N-side only with the external shunt resistor and RC filter)

- a1. Normal operation : IGBT ON and carrying current.
- a2. Short circuit is detected (SC trigger).
- a3. All N-side IGBTs' gates are hard interrupted.
- a4. All N-side IGBTs turn OFF.
- a5. Fo is output ($t_{FO(min)} = 40\mu s$).
- a6. Input "L".
- a7. Input "H". But IGBT is still OFF state during outputting Fo.
- a8. IGBT turns ON when L→H signal is input after Fo is reset.

[B] Under-Voltage Protection (N-side, UVd)

- b1. Control supply voltage V_D rises : After V_D level rises over under voltage reset level (UV_{Dr}), the circuits start to operate when next input is applied.
- b2. Normal operation : IGBT ON and carrying current.
- b3. V_D level dips to under voltage trip level. (UV_{Dt}).
- b4. All N-side IGBTs turn OFF in spite of control input condition.
- b5. Fo is output. ($t_{FO} \geq 40\mu s$ and Fo outputs continuously during UV period).
- b6. V_D level rises over UV_{Dr} .
- b7. Normal operation : IGBT ON and carrying current.

- c2. Normal operation : IGBT ON and carrying current.
- c3. VDB level dips to under voltage trip level. (UVDBt).
- c4. P-side IGBT turns OFF in spite of control input signal level, but there is no Fo signal output.
- c5. VDB level rises over UVDBr.
- c6. Normal operation : IGBT ON and carrying current.

Fig. 10 AN INSTANCE OF INTERFACE CIRCUIT

Note : The setting of RC coupling at each input (parts shown dotted) depends on the PWM control scheme and the wiring impedance of the printed circuit board.
Input circuit integrates a 3.3kΩ (min) pull-down resistor. Therefore, when using an external filtering resistor, pay attention to the turn-on threshold voltage.

Fig. 12 AN EXAMPLE OF TYPICAL DIPIPM APPLICATION CIRCUIT

- Note 1** : Input drive is High-active type. There is a 3.3kΩ (Min.) pull-down resistor in the input circuit of IC. To prevent malfunction, the wiring of each input should be as short as possible. When using RC coupling circuit, make sure the input signal level meet the turn-on and turn-off threshold voltage.
- 2** : Thanks to HVIC inside the module, direct coupling to MCU without any opto-coupler or transformer isolation is possible.
- 3** : Fo output is open drain type. It should be pulled up to the MCU or control power supply (e.g. 5V, 15V) by a resistor that makes If_o up to 1mA.
- 4** : To prevent erroneous protection, the wiring of A, B, C should be as short as possible.
- 5** : The time constant R1C4 of the protection circuit should be selected in the range of 1.5-2μs. SC interrupting time might vary with the wiring pattern. Tight tolerance, temp-compensated type is recommended for R1, C4
- 6** : All capacitors should be mounted as close to the terminals of DIPIPM as possible. (C1: good temperature, frequency characteristic electrolytic type, and C2, C3 (0.22~2μF) : good temperature, frequency and DC bias characteristic ceramic type are recommended.)
- 7** : To prevent surge destruction, the wiring between the smoothing capacitor and the P, N1 terminals should be as short as possible. Generally a 0.1-0.22μF snubber between the P-N1 terminals is recommended.
- 8** : Two Vnc terminals (9 & 16 pin) are connected inside DIPIPM, please connect either one to the 15V power supply GND and leave the other open.
- 9** : It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.
- 10** : If control GND is connected with power GND by common broad pattern, it may cause malfunction by power GND fluctuation. It is recommended to connect control GND and power GND at only a point N1.
- 11** : High voltage (VRRM =600V or more) and fast recovery type (trr=100ns or less) diodes should be used in the bootstrap circuit.
