

## **RF2418** LOW CURRENT LNA/MIXER

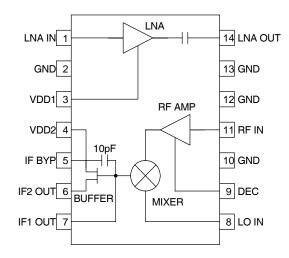

#### **RoHS Compliant & Pb-Free Product** Package Style: SOIC-14

### **Features**

- Single 3V to 6.5V Power Supply
- High Dynamic Range
- Low Current Drain
- High LO Isolation
- LNA Power Down Mode for Large Signals

### **Applications**

- UHF Digital and Analog Receivers
- Digital Communication Systems
- Spread-Spectrum Communication Systems
- Commercial and Consumer Systems
- 433 MHz and 915 MHz ISM Band Receivers
- General Purpose Frequency Conversion

Functional Block Diagram

### **Product Description**

The RF2418 is a monolithic integrated UHF receiver front-end. The IC contains all of the required components to implement the RF functions of the receiver except for the passive filtering and LO generation. It contains an LNA (low-noise amplifier), a second RF amplifier, a dual-gate GaAs FET mixer, and an IF output buffer amplifier which will drive a 50 $\Omega$  load. In addition, the IF buffer amplifier may be disabled and a high impedance output is provided for easy matching to IF filters with high impedances. The output of the LNA is made available as an output to permit the insertion of a bandpass filter between the LNA and the RF/Mixer section. The LNA section may be disabled by removing the VDD1 connection to the IC.

#### **Absolute Maximum Ratings**

| Parameter                     | Rating      | Unit            |
|-------------------------------|-------------|-----------------|
| Supply Voltage                | -0.5 to 7   | V <sub>DC</sub> |
| Input LO and RF Levels        | +6          | dBm             |
| Ambient Operating Temperature | -40 to +85  | °C              |
| Storage Temperature           | -40 to +150 | °C              |

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

rfmd.com

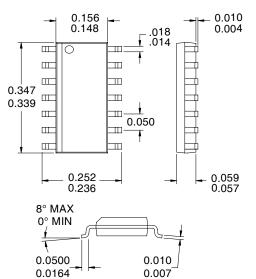

| Pin | Function | Description  | Interface Schematic |
|-----|----------|--|---------------------|
| 1   | LNA IN   | A series 10nH matching inductor is necessary to achieve specified gain<br>and noise figure at 900MHz. This pin is NOT internally DC-blocked. An<br>external blocking capacitor must be provided if the pin is connected to a<br>device with DC present. A DC path to ground (i.e. an inductor or resistor to<br>ground) is, however, acceptable at this pin. If a blocking capacitor is<br>required, a value of 22pF is recommended.   |                     |
| 2   | GND      | Ground connection. Keep traces physically short and connect immediately to ground plane for best performance.  |                     |
| 3   | VDD1     | Supply Voltage for the LNA only. A 22 pF external bypass capacitor is required and an additional 0.01 µF is required if no other low frequency bypass capacitors are near by. The trace length between the pin and the bypass capacitors should be minimized. The ground side of the bypass capacitors should connect immediately to ground plane.<br>For large input signals, VDD1 may be disconnected, resulting in the LNA's gain changing from +11dB to -26dB and current drain decreasing by 4 mA. If the LNA is never required for use, then this pin can be left unconnected or grounded, and Pin 11 is used as the first input.  |                     |
| 4   | VDD2     | Power supply for the IF buffer amplifier. If the high impedance mixer output is being used, then this pin is not connected.  |                     |
| 5   | IF BYP   | If this pin is connected to ground, an internal 10pF capacitor is connected<br>in parallel with the mixer output. This capacitor functions as an LO trap,<br>which reduces the amount of LO to IF bleed-through and prevents high LO<br>voltages at the mixer output from degrading the mixer's dynamic range. At<br>higher IF frequencies, this capacitance, along with parasitic layout capaci-<br>tance, should be parallel resonated out by the choice of the bias inductor<br>value at pin 7. If the internal capacitor is not connected to ground, the<br>buffer amplifier could become unstable. A ~10pF capacitor should be<br>added at the output to maintain the buffer's stability, but the gain will not<br>be significantly affected. |                     |
| 6   | IF2 OUT  | $50\Omega$ buffered (open source) output port, one of two output options. Pin 7 must have a bias resistor to $V_{DD}$ and pin 6 must have a bias resistor to ground (see Buffered Output Application Schematic) in order to turn the buffer amplifier on. Current drain will increase by approximately 8mA at 5V, and by approximately 5mA at 3V. It is recommended that these bias resistors be less than $1  \mathrm{k} \Omega$ .  |                     |
| 7   | IF1 OUT  | High impedance (open drain) output port, one of two output options. This pin must be connected to $V_{DD}$ through a resistor or inductor in order to bias the mixer, even when using IF2 Output. In addition, a $0.01\mu F$ bypass capacitor is required at the other end of the bias resistor or inductor. The ground side of the bypass capacitor should connect immediately to ground plane. This output is intended to drive high impedance IF filters. The recommended matching network is shunt L, series C (see the application schematic, high impedance output). This topology will provide matching, bias, and DC-blocking.   |                     |
| 8   | LO IN    | Mixer LO input. A high-pass matching network, such as a single shunt<br>inductor (as shown in the application schematics), is the recommended<br>topology because it also rejects IF noise at the mixer input. This filtering is<br>required to achieve the specified noise figures. This pin is NOT internally<br>DC-blocked. An external blocking capacitor must be provided if the pin is<br>connected to a device with DC present. A DC path to ground (i.e. an induc-<br>tor or resistor to ground) is, however, acceptable at this pin. If a blocking<br>capacitor is required, a value of 22pF is recommended.  |                     |
| 9   | RF BYP   | Connection for the external bypass capacitor for the mixer RF input preamp. 1000pF is recommended. The trace length between the pin and the capacitor should be minimized. The ground side of the bypass capacitor should connect immediately to ground plane.   |                     |

rfmd.com

| Pin | Function | Description   | Interface Schematic |
|-----|----------|---|---------------------|
| 10  | GND      | Same as pin 2.  |                     |
| 11  | RF IN    | Mixer RF Input port. For a $50\Omega$ match at 900MHz use a 15nH series<br>inductor. This pin is NOT internally DC-blocked. An external blocking capac-<br>itor must be provided if the pin is connected to a device with DC present. A<br>DC path to ground (i.e. an inductor or resistor to ground) is, however,<br>acceptable at this pin. If a blocking capacitor is required, a value of 22 pF is<br>recommended. To minimize the mixer's noise figure, it is recommended to<br>have a RF bandpass filter before this input. This will prevent the noise at<br>the image frequency from being converted to the IF. |                     |
| 12  | GND      | Same as pin 2.  |                     |
| 13  | GND      | Same as pin 2.  |                     |
| 14  | LNA OUT  | 50Ω output. Internally DC-blocked.  |                     |

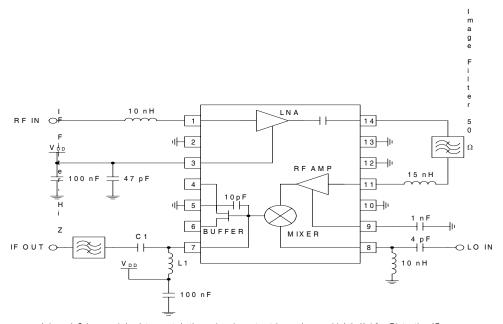

### **Package Drawing**

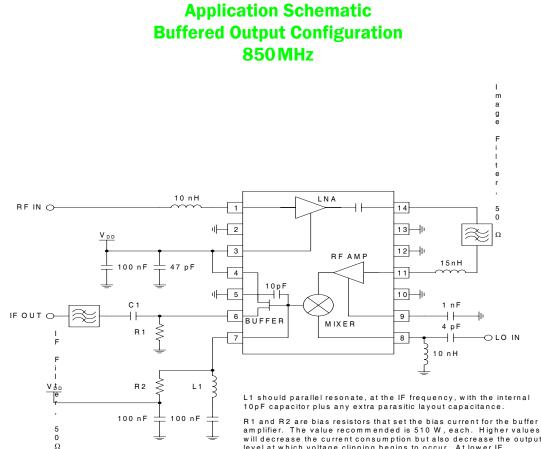

L1 and C1 are picked to match the mixer's output impedance (4 k $\Omega$  II 10 pF) to the IF filter's impedance, at the IF frequency. C1 also serves as a DC block, in case the IF filter is not an open circuit at DC.

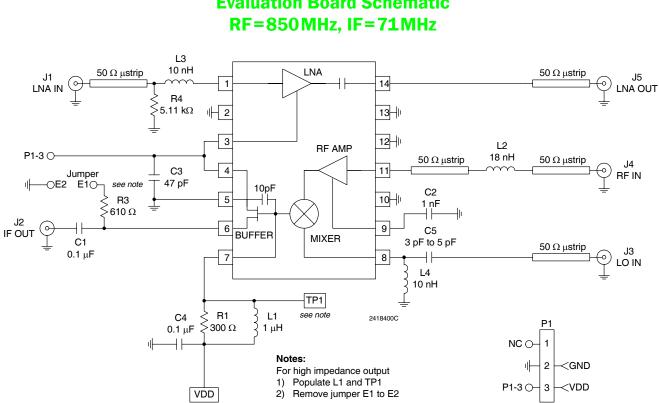

will decrease the current consumption but also decrease the output level at which voltage clipping begins to occur. At lower IF frequencies, where the internal 10 pF capacitor does not roll off the conversion gain, L1 may be eliminated.

C1 is a blocking capacitor, in case the IF filter's input is not an open circuit at DC .
