

RFMD
RF5616BE201e
KEMD

Features

- Single Supply Voltage 3.0V to 5.0V
- Two Mode Operation
- 29dB Typical Gain Across Band
- Pout: 18dBm at 3.3V Typ.
Pout: 21dBm at 5V Typ.
- Integrated Second and Third Harmonic Filter

Applications

- IEEE802.11a/n and IEEE802.16e Applications
- HyperLAN
- WiFi Systems
- Commercial and Consumer Systems
- Portable Battery-Powered Equipment
- Spread-Spectrum and MMDS Systems

Package Style: QFN, 16-Pin, 3mmx3mmx0.45mm

Functional Block Diagram

Product Description

The RF5616 is a linear, medium-power, high-efficiency power amplifier IC designed specifically for battery-powered WiFi applications such as PC cards, mini PCI, and compact flash applications. It is also designed to meet IEEE802.11a, IEEE802.11n, IEEE802.16e (4.9GHz to 5.850GHz only) WiMax, FCC, and ETSI requirements for operation in the 4.9GHz to 5.850GHz band. The device is manufactured on an advanced InGaP GaAs Heterojunction Bipolar Transistor process, and has been designed for use as the final RF amplifier in 5GHz WiFi and other spread-spectrum transmitters. The device is provided in a QFN, 16-pin, 3mmx3mmx0.45mm, leadless chip carrier with backside ground. The RF5616 operates from a single supply and will be easily incorporated into WiFi and other designs with minimal external components.

**Caution!** ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

| Pin | Function | Description |
|---|----------|---|
| 1, 2, 4, 11, 12, 13, 14, 15 | N/C | Not internally connected. |
| 3 | RFIN | RF Input Pin, Internally matched to 50Ω and DC blocked. |
| 5 | VREG | First, second, and third stage bias voltage combined on the die to one external voltage. This Pin requires regulated supply for best performance. |
| 6, 7, 8 | VCC | Supply voltage for the PA. Internally decoupled with approximately 100pF . |
| 9 | PDETECT | Power detector voltage is proportional to RF output power. May need external decoupling capacitor for module stability. May need external circuitry to bring output voltage to desired level. |
| 10 | RF OUT | RF output pin. This pin is matched to 50Ω internally. This pin has a DC blocking cap from the collector side of the final stage but it is an RF short at the RF OUT Pins 10 and 12 therefore an external DC blocking capacitor is needed if DC voltage is presented to the RF OUT pins. See functional block diagram on the first page for more details. |
| 16 | VMODE | This pin will allow the power amplifier to switch between two modes. The first mode is the mode 1, in which this pin needs to be logic low or floating. The second mode is mode 2 which allows the power amplifier to be in a low current and this pin needs to be logic high. |
| Pkg Base | GND | Ground connection. |

Package Drawing

QFN, 16-Pin, 3x3x0.45mm

- NOTES:
- 1 DIMENSION APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25mm AND 0.30mm FROM TERMINAL TIP.
 - 2 DIMENSION REPRESENTS TERMINAL PULL BACK FROM PACKAGE EDGE UP TO 0.1mm IS ACCEPTABLE.
 - 3 COPLANARITY APPLIES TO THE EXPOSED HEAT SLUG AS WELL AS THE TERMINAL.

4 RADIUS ON TERMINALS IS OPTIONAL.

PCB Design Requirements

PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3 micro-inch to 8 micro-inch gold over 180 micro-inch nickel.

PCB Land Pattern Recommendation *

PCB land patterns for RFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

PCB Metal Land Pattern

$$A = 0.230 \times 0.360 \text{ (mm) Typ}$$

$$B = 0.360 \times 0.230 \text{ (mm) Typ}$$

$$C = 1.700 \text{ (mm) Sq}$$

PCB Solder Mask Pattern

Liquid Photo-Imageable (LPI) solder mask is recommended. The solder mask footprint will match what is shown for the PCB metal land pattern with a 2 mil to 3 mil expansion to accommodate solder mask registration clearance around all pads. The center-grounding pad shall also have a solder mask clearance. Expansion of the pads to create solder mask clearance can be provided in the master data or requested from the PCB fabrication supplier.

$$A = 0.38 \times 0.51 \text{ (mm) Typ}$$

$$B = 0.51 \times 0.38 \text{ (mm) Typ}$$

$$C = 1.85 \text{ (mm) Sq}$$

**Thermal Pad and Via Design**

The PCB land pattern has been designed with a thermal pad that matches the die paddle size on the bottom of the device.

Thermal vias are required in the PCB layout to effectively conduct heat away from the package. The via pattern has been designed to address thermal, power dissipation and electrical requirements of the device as well as accommodating routing strategies.

The via pattern used for the RFMD qualification is based on thru-hole vias with 0.203mm to 0.330mm finished hole size on a 0.5mm to 1.2mm grid pattern with 0.025mm plating on via walls. If micro vias are used in a design, it is suggested that the quantity of vias be increased by a 4:1 ratio to achieve similar results.
