5.0 Pin Description

Pin Name	Function	Pin Name	Function
A0 ~ A12	Address input (Multiplexed)	DQM0 ~ 7	DQM
BA0 ~ BA1	Select bank	VDD	Power supply (3.3V)
DQ0 ~ DQ63	Data input/output	Vss	Ground
CB0 ~ CB7	Check bit (Data-in/data-out)	*VREF	Power supply for reference
CLK0 ~ 3	Clock input	REGE	Register enable
CKE0, CKE1	Clock enable input	SDA	Serial data I/O
CS0 ~ CS3	Chip select input	SCL	Serial clock
RAS	Row address strobe	SA0 ~ 2	Address in EEPROM
CAS	Columne address strobe	DU	Don't use
WE	Write enable	NC	No connection

6.0 Pin Configuration Description

Pin	Name	Input Function
CLK	System clock	Active on the positive going edge to sample all inputs.
CS	Chip select	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	Clock enable	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby. CKE should be enabled 1CLK+tss prior to valid command.
A0 ~ A12	Address	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA12 Column address : (x4 : CA0 ~ CA9, CA11, CA12), (x8 : CA0 ~ CA9, CA11)
BA0 ~ BA1	Bank select address	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
RAS	Row address strobe	Latches row addresses on the positive going edge of the CLK with RAS low. Enables row access & precharge.
CAS	Column address strobe	Latches column addresses on the positive going edge of the CLK with CAS low. Enables column access.
WE	Write enable	Enables write operation and row precharge. Latches data in starting from CAS, WE active.
DQM0 ~ 7	Data input/output mask	Makes data output Hi-Z, tshz after the clock and masks the output. Blocks data input when DQM active. (Byte masking)
REGE	Register enable	The device operates in the transparent mode when REGE is low. When REGE is high, the device operates in the registered mode. In registered mode, the Address and control inputs are latched if CLK is held at a high or low logic level. the inputs are stored in the latch/flip-flop on the rising edge of CLK. REGE is tied to VDD through 10K ohm Resistor on PCB. So if REGE of module is floating, this module will be operated as registered mode.
DQ0 ~ 63	Data input/output	Data inputs/outputs are multiplexed on the same pins.
CB0 ~ 7	Check bit	Check bits for ECC.
VDD/Vss	Power supply/ground	Power and ground for the input buffers and the core logic.

*2. Register Output

*3. SDRAM

td, tr = Delay of register

: Don't care

Note :

1. In case of module timing, command cycles delayed 1CLK with respect to external input timing at the address and input signal because of the buffering in register. Therefore, Input/Output signals of read/write function should be issued 1CLK earlier as compared to Unbuffered DIMMs.
2. DIN is to be issued 1clock after write command in external timing because DIN is issued directly to module.

1. The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
2. Minimum delay is required to complete write.
3. All parts allow every cycle column address change.
4. In case of row precharge interrupt, auto precharge and read burst stop.
5. In 100MHz and below 100MHz operating conditions, tRDL=1CLK and tDAL=1CLK + 20ns is also supported. SAMSUNG recommends tRDL=2CLK and tDAL=2CLK + tRP.

Note :

1. Parameters depend on programmed CAS latency.
2. If clock rising time is longer than 1ns, (tr/2-0.5)ns should be added to the parameter.
3. Assumed input rise and fall time (tr & tf) = 1ns.
If tr & tf is longer than 1ns, transient time compensation should be considered,
i.e., [(tr + tf)/2-1]ns should be added to the parameter.

Note :

- OP Code : Operand code
- A0 ~ A12 & BA0 ~ BA1 : Program keys. (@ MRS)
- MRS can be issued only at all banks precharge state.
A new command can be issued after 2 clock cycles of MRS.
- Auto refresh functions are as same as CBR refresh of DRAM.
The automatical precharge without row precharge command is meant by "Auto".
Auto/self refresh can be issued only at all banks precharge state.
- BA0 ~ BA1 : Bank select addresses.
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.
If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.
If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.
If A10/AP is "High" at row precharge, BA0 and BA1 is ignored and all banks are selected.
- During burst read or write with auto precharge, new read/write command can not be issued.
Another bank read/write command can be issued after the end of burst.
New row active of the associated bank can be issued at tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
