6. Input/Output Function Description

Symbol	Type	Description
CK0-CK1 CK0-CK1	Input	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of CK . A Delay Locked Loop (DLL) circuit is driven from the clock input and output timing for read operations is synchronized to the input clock.
CKE0-CKE1	Input	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low, By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refesh mode.
S0-S1	Input	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by S0, Rank 1 is selected by S1. Ranks are also called “Physical banks”.
RAS, CAS, WE	Input	When sampled at the cross point of the rising edge of CK and falling edge of CK, CAS, RAS, and WE define the operation to be executed by the SDRAM.
BA0~BA2	Input	Selects which DDR2 SDRAM internal bank is activated.
ODT0~ODT1	Input	Asserts on-die termination for DQ, DM, DQS, and DQS signals if enabled via the DDR2 SDRAM Extended Mode Register Set (EMRS).
A0~A9, A10/AP, A11~A13	Input	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of CK. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of CK. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be pecharged regardiess of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ0~DQ63	In/Out	Data Input/Output pins.
DM0~DM7	Input	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
DQS0~DQS7 DQS0~DQS7	In/Out	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR2 SDRAMs and is sent at the leading edge of the data window. DQS signals are complements, and timing is relative to the crosspoint of respective DQS and DQS If the module is to be operated in single ended strobe mode, all DQS signals must be tied on the system board to V_{SS} and DDR2 SDRAM mode registers programmed appropriately.
V_{DD},V_{DDSPD},V_{SS}	Supply	Power supplies for core, I/O, Serial Presence Detect, and ground for the module.
SDA	In/Out	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor must be connected to V_{DD} to act as a pull up.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from SCL to V_{DD} to act as a pull up.
SA0~SA1	Input	Address pins used to select the Serial Presence Detect base address.
TEST	In/Out	The TEST pin is reserved for bus analysis tools and is not connected on normal memory modules(SO-DIMMs).

T_{STG}	Storage Temperature	-55 to +100	°C	1, 2

NOTE :
1. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

9. AC & DC Operating Conditions

9.1 Recommended DC Operating Conditions (SSTL - 1.8)

Symbol	Parameter	Rating			Units	NOTE
		Min.	Typ.	Max.		
V_{DD}	Supply Voltage	1.7	1.8	1.9	V	
V_{DDL}	Supply Voltage for DLL	1.7	1.8	1.9	V	4
V_{DDQ}	Supply Voltage for Output	1.7	1.8	1.9	V	4
V_{REF}	Input Reference Voltage	0.49*V_{DDQ}	0.50*V_{DDQ}	0.51*V_{DDQ}	mV	1,2
V_{TT}	Termination Voltage	V_{REF}-0.04	V_{REF}	V_{REF}+0.04	V	3

Symbol	Parameter	Rating		Units	NOTE
		Min.	Max.		
V_{DDSPD}	Core Supply Voltage	1.7	3.6	V	5

NOTE : There is no specific device V_{DD} supply voltage requirement for SSTL-1.8 compliance. However under all conditions V_{DDQ} must be less than or equal to V_{DD}.
1. The value of V_{REF} may be selected by the user to provide optimum noise margin in the system. Typically the value of V_{REF} is expected to be about 0.5 x V_{DDQ} of the transmitting device and V_{REF} is expected to track variations in V_{DDQ}.
2. Peak to peak AC noise on V_{REF} may not exceed +/-2% V_{REF}(DC).
3. V_{TT} of transmitting device must track V_{REF} of receiving device.
4. AC parameters are measured with V_{DD}, V_{DDQ} and V_{DDL} tied together.
5. SODIMMs that include an optional temperature sensor may require a restricted V_{DDSPD} operating voltage range for proper operation of the temperature sensor. Refer to the thermal sensor specification for details regarding the supported voltage range. All other functions of the SODIMM SPD are supported across the full V_{DDSPD} range.

9.2 Operating Temperature Condition

Symbol	Parameter	Rating	Units	NOTE
T_{OPER}	Operating Temperature	0 to 95	°C	1, 2

NOTE :
1. Operating Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51.2 standard.
2. At 85 - 95 °C operation temperature range, doubling refresh commands in frequency to a 32ms period (tREFI=3.9 us) is required, and to enter to self refresh mode at this temperature range, an EMRS command is required to change internal refresh rate.

9.3 Input DC Logic Level

Symbol	Parameter	Min.	Max.	Units	NOTE
V_{IH}(DC)	DC input logic high	V_{REF} + 0.125	V_{DDQ} + 0.3	V	
V_{IL}(DC)	DC input logic low	- 0.3	V_{REF} - 0.125	V	

9.4 Input AC Logic Level

Symbol	Parameter	DDR2-667/800		Units
		Min.	Max.	
V_{IH}(AC)	AC input logic high	V_{REF} + 0.200		V
V_{IL}(AC)	AC input logic low		V_{REF} - 0.200	V

9.5 AC Input Test Conditions

Symbol	Condition	Value	Units	NOTE
V_{REF}	Input reference voltage	0.5 * V_{DDQ}	V	1
$V_{SWING(MAX)}$	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

NOTE :
1. Input waveform timing is referenced to the input signal crossing through the $V_{IH/IL}$(AC) level applied to the device under test.
2. The input signal minimum slew rate is to be maintained over the range from V_{REF} to V_{IH}(AC) min for rising edges and the range from V_{REF} to V_{IL}(AC) max for falling edges as shown in the below figure.
3. AC timings are referenced with input waveforms switching from V_{IL}(AC) to V_{IH}(AC) on the positive transitions and V_{IH}(AC) to V_{IL}(AC) on the negative transitions.
