

## AM387x Sitara™ ARM® Microprocessors (MPUs)

Check for Samples: [AM3874](#), [AM3872](#), [AM3871](#)

### 1 High-Performance System-on-Chip (SoC)

#### 1.1 Features

- **High-Performance Sitara™ ARM® Microprocessors (MPUs)**
    - Up to 1-GHz ARM® Cortex™-A8 RISC MPU
  - **ARM® Cortex™-A8 Core**
    - ARMv7 Architecture
      - In-Order, Dual-Issue, Superscalar Microprocessor Core
      - NEON™ Multimedia Architecture
      - Supports Integer and Floating Point
      - Jazelle® RCT Execution Environment
  - **ARM® Cortex™-A8 Memory Architecture**
    - 32K-Byte Instruction and Data Caches
    - 512K-Byte L2 Cache
    - 64K-Byte RAM, 48K-Byte Boot ROM
  - **128K-Bytes On-Chip Memory Controller (OCMC) RAM**
  - **Imaging Subsystem (ISS)**
    - Camera Sensor Connection
      - Parallel Connection for Raw (up to 16-Bit) and BT.656/BT.1120 (8-/16-bit)
    - Image Sensor Interface (ISIF) for Handling Image/Video Data From the Camera Sensor
    - Resizer
      - Resizing Image/Video From 1/16x to 8x
      - Generating Two Different Resizing Outputs Concurrently
  - **Media Controller**
    - Controls the HDVPSS and ISS
  - **SGX530 3D Graphics Engine**
    - Delivers up to 18 MPoly/sec
    - Universal Scalable Shader Engine
    - Direct3D Mobile, OpenGL ES 1.1 and 2.0, OpenVG 1.0, OpenMax API Support
    - Advanced Geometry DMA Driven Operation
    - Programmable HQ Image Anti-Aliasing
  - **Endianness**
    - ARM Instructions/Data – Little Endian
  - **HD Video Processing Subsystem (HDVPSS)**
    - Two 165 MHz HD Video Capture Inputs
      - One 16/24-bit Input, Splittable into Dual 8-bit SD Capture Ports
    - One 8/16/24-bit Input
    - One 8-bit Only Input
  - Two 165 MHz HD Video Display Outputs
    - One 16/24/30-bit and one 16/24-bit Output
  - Composite or S-Video Analog Output
  - MacroVision® Support Available
  - Digital HDMI 1.3 transmitter With Integrated PHY
  - Advanced Video Processing Features Such as Scan/Format/Rate Conversion
  - Three Graphics Layers and Compositors
- **Dual 32-bit LPDDR/DDR2/DDR3 SDRAM Interfaces**
  - Supports up to LPDDR-400, DDR2-800, and DDR3-800
  - Up to Eight x 8 Devices Total 2 GB Total Address Space
  - Dynamic Memory Manager (DMM)
    - Programmable Multi-Zone Memory Mapping and Interleaving
    - Enables Efficient 2D Block Accesses
    - Supports Tiled Objects in 0°, 90°, 180°, or 270° Orientation and Mirroring
    - Optimizes Interlaced Accesses
- **General Purpose Memory Controller (GPMC)**
  - 8-/16-bit Multiplexed Address/Data Bus
  - 512M-Byte Total Address Space Divided Among up to 8 Chip Selects
  - Glueless Interface to NOR Flash, NAND Flash (BCH/Hamming Error Code Detection), SRAM and Pseudo-SRAM
  - Error Locator Module (ELM) Outside of GPMC to Provide Upto 16-Bit/512-Bytes Hardware ECC for NAND
  - Flexible Asynchronous Protocol Control for Interface to FPGA, CPLD, ASICs, etc.
- **Enhanced Direct-Memory-Access (EDMA) Controller**
  - Four Transfer Controllers
  - 64/8 Independent DMA/QDMA Channels

- **Dual Port Ethernet (10/100/1000 Mb/s) With Optional Switch**
  - IEEE 802.3 Compliant (3.3V I/O Only)
  - MII/RMII/GMII/RGMII Media Independent I/Fs
  - Management Data I/O (MDIO) Module
  - Reset Isolation
  - IEEE-1588 Time-Stamping and Industrial Ethernet Protocols
- **Dual USB 2.0 Ports With Integrated PHYs**
  - USB2.0 High-/Full-Speed Clients
  - USB2.0 High-/Full-/Low-Speed Hosts, or OTG
  - Supports End Points 0-15
- **One PCI Express 2.0 Port With Integrated PHY**
  - Single Port With 1 Lane at 5.0 GT/s
  - Configurable as Root Complex or Endpoint
- **Eight 32-bit General-Purpose Timers (Timer1–8)**
- **One System Watchdog Timer (WDT 0)**
- **Six Configurable UART/IrDA/CIR Modules**
  - UART0 With Modem Control Signals
  - Supports up to 3.6864 Mbps UART0/1/2
  - Supports up to 12 Mbps UART3/4/5
  - SIR, MIR, FIR (4.0 MBAUD), and CIR
- **Four Serial Peripheral Interfaces (SPIs) [up to 48-MHz]**
  - Each With Four Chip-Selects
- **Three MMC/SD/SDIO Serial Interfaces [up to 48-MHz]**
  - Three Supporting up to 1-/4-/8-Bit Modes
- **Dual Controller Area Network (DCAN) Modules**
  - CAN Version 2 Part A, B
- **Four Inter-Integrated Circuit (I2C Bus™) Ports**
- **Six Multi-Channel Audio Serial Ports (McASP)**
  - Dual Ten Serializer Transmit/Receive Ports
  - Quad Four Serializer Transmit/Receive Ports
- DIT-Capable For S/PDIF (All Ports)
- **Multi-Channel Buffered Serial Port (McBSP)**
  - Transmit/Receive Clocks up to 48 MHz
  - Two Clock Zones and Two Serial Data Pins
  - Supports TDM, I2S, and Similar Formats
- **Serial ATA (SATA) 3.0 Gbps Controller With Integrated PHY**
  - Direct Interface to One Hard Disk Drive
  - Hardware-Assisted Native Command Queuing (NCQ) from up to 32 Entries
  - Supports Port Multiplier and Command-Based Switching
- **Real-Time Clock (RTC)**
  - One-Time or Periodic Interrupt Generation
- **Up to 128 General-Purpose I/O (GPIO) Pins**
- **One Spin Lock Module with up to 128 Hardware Semaphores**
- **One Mailbox Module with 12 Mailboxes**
- **On-Chip ARM ROM Bootloader (RBL)**
- **Power, Reset, and Clock Management**
  - SmartReflex™ Technology (Level 2b)
  - Multiple Independent Core Power Domains
  - Multiple Independent Core Voltage Domains
  - Support for Three Operating Points (OPP120/100/50) per Voltage Domain
  - Clock Enable/Disable Control for Subsystems and Peripherals
- **32KB Embedded Trace Buffer™ (ETB™) and 5-pin Trace Interface for Debug**
- **IEEE-1149.1 (JTAG) Compatible**
- **684-Pin Pb-Free BGA Package (CYE Suffix), 0.8-mm Ball Pitch With Via Channel™ Technology to Reduce PCB Cost**
- **45-nm CMOS Technology**
- **1.8-/3.3-V Dual Voltage Buffers for General I/O**

## 1.2 Applications

- Single Board Computing
- Network and Communications Processing
- Industrial Automation
- Human Machine Interface
- Interactive Point-of-Service/Information Kiosks
- Portable Data Terminals

### 1.3 Description

AM387x Sitara™ ARM® MPUs are a highly-integrated, programmable platform that leverages TI's Sitara™ Microprocessor technology to meet the processing needs of the following applications: Single-Board Computing, Network and Communications Processing, Industrial Automation, Human Machine Interface, and Interactive Point-of-Service/Information Kiosks, and Portable Data Terminals.

The device enables Original-Equipment Manufacturers (OEMs) and Original-Design Manufacturers (ODMs) to quickly bring to market devices featuring robust operating systems support, rich user interfaces, and high processing performance through the maximum flexibility of a fully integrated mixed processor solution. The device also combines programmable ARMprocessing with a highly integrated peripheral set.

The AM387x Sitara™ ARM® MPUs also present OEMs and ODMs with new levels of processor scalability and software reuse. An OEM or ODM that used the AM387x MPU in a design and sees an opportunity to make a similar product with added features could scale up to the pin-compatible and software-compatible TMS320DM814x processors from Texas Instruments (TI). The TMS320DM814x DaVinci™ Digital Media processors add a powerful C674x™ core DSP along with a video encoder/decoder to the hardware on the AM38x. Additionally, OEMs or ODMs that have used the AM387x or DM814x processors and find a need for a faster ARM and/or DSP core performance could scale up to the software-compatible AM389x, TMS320C6A816x, or TMS320DM816x devices with higher core speeds.

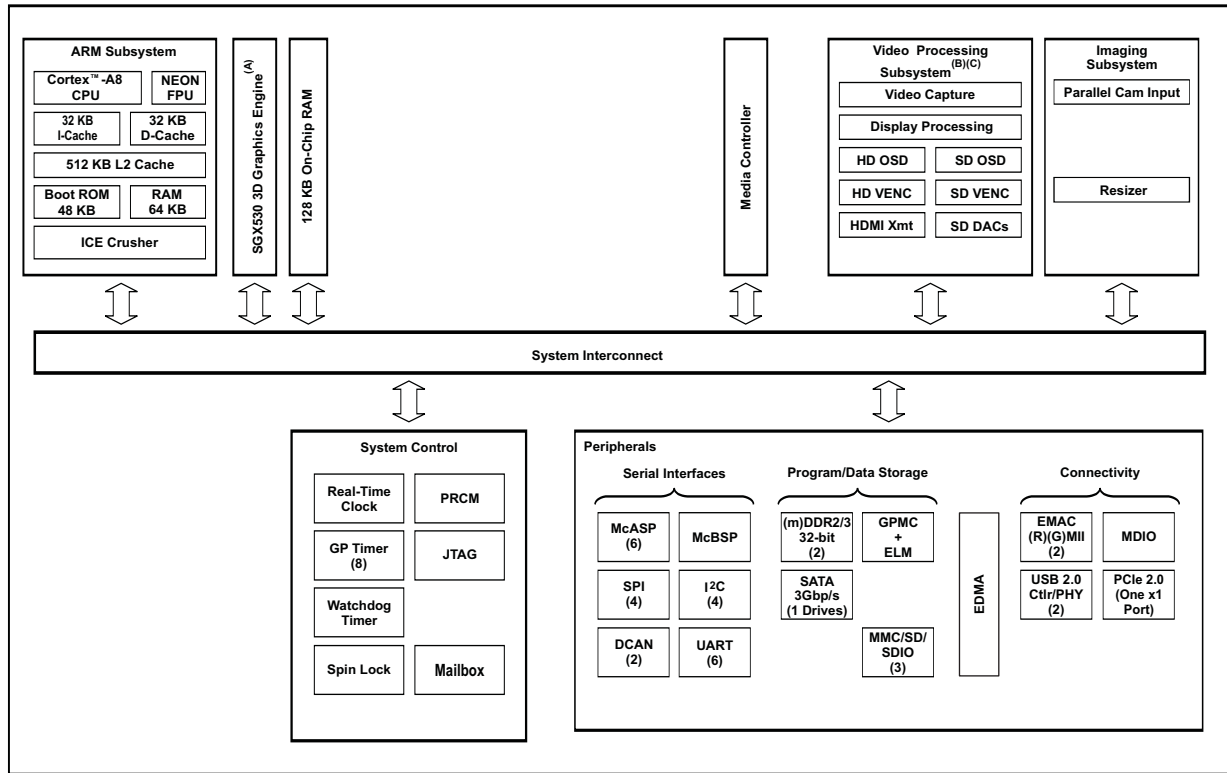

Programmability is provided by an ARM Cortex™-A8 RISC CPU with Neon™ extension. The ARM allows developers to keep control functions separate from algorithms programmed on coprocessors, thus reducing the complexity of the system software. The ARM Cortex™-A8 32-bit RISC microprocessor with Neon™ floating-point extension includes: 32 Kbytes (KB) of Instruction cache; 32KB of Data cache; 512KB of L2 Cache; 48KB of Boot ROM; and 64KB of RAM.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections in this document and the associated peripheral reference guides. The peripheral set includes: HD Video Processing Subsystem; Dual Port Gigabit Ethernet MACs (10/100/1000 Mbps) [Ethernet Switch] with MII/RMII/GMII/RGMII and MDIO interface supporting IEEE-1588 Time-Stamping and Industrial Ethernet Protocols; two USB ports with integrated 2.0 PHY; PCIe x1 GEN2 Compliant interface; two 10-serializer McASP audio serial ports (with DIT mode); four quad-serilaizer McASP audio serial ports (with DIT mode); one McBSP multichannel buffered serial port; six UARTs with IrDA and CIR support; four SPI serial interfaces; three MMC/SD/SDIO serial interfaces; four I2C master/slave interfaces; a Parallel Camera Interface (CAM); up to 128 General-Purpose IOs (GPIOs); eight 32-bit general-purpose timers; System watchdog timer; Dual LPDDR/DDR2/DDR3 SDRAM interfaces; flexible 8/16-bit asynchronous memory interface; two Controller Area Network (DCAN) modules; a Spin Lock; Mailbox; and Serial Hard Disk Drive Interface (SATA 300).

The AM387x Sitara™ ARM® MPUs also include a SGX530 3D graphics engine to off-load many graphics processing tasks from the ARM core, making more ARM MIPS available for common processing tasks on algorithms. Additionally, it has a complete set of development tools for the ARM which include C compilers and a Microsoft® Windows™ debugger interface for visibility into source code execution.

### 1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the device.

- A. SGX530 is only available on the AM3874 device.
- B. HDMI is only available on the AM3874 and AM3872 devices.
- C. Video Ports (Inputs/Outputs) are only available on the AM3874 and AM3872 devices.

## 2 Device Overview

### 2.1 Device Comparison

Table 2-1 shows a comparison between devices, highlighting the differences.

**Table 2-1. AM387x Device Comparison**

FEATURES		DEVICES		
		AM3874	AM3872	AM3871
HDVPSS	Video Ports (Inputs)	VIN[0]/VIN[1]	VIN[0]/VIN[1]	NONE
	Video Ports (Outputs)	VOUT[0]/VOUT[1]	VOUT[0]/VOUT[1]	NONE
HDMI		YES (1)	YES (1)	NONE
SGX530		YES (1)	NONE	NONE

### 2.2 Device Characteristics

Table 2-2 provides an overview of the AM387x Sitara™ ARM Microprocessors (MPUs), which includes significant features of the device, including the capacity of on-chip RAM, peripherals, and the package type with pin count.

PRODUCT PREVIEW

**Table 2-2. Characteristics of the Processor**

HARDWARE FEATURES		AM387x
Peripherals  Not all peripherals pins are available at the same time (for more details, see the Device Configurations section).	HD Video Processing Subsystem (HDVPSS)	1 16-/24-bit HD Capture Port <b>or</b> 2 8-bit SD Capture Ports <b>and</b> 1 8/16/24-bit HD Capture Port <b>and</b> 1 8-bit SD Capture Port <b>and</b> 1 16-/24-/30-bit HD Display Port <b>or</b> 1 HDMI 1.3 Transmitter <b>and</b> 1 16-/24-bit HD Display Port <b>and</b> 2 SD Video DACs
	Imaging Subsystem (ISS)	1 Parallel Camera Input for Raw (up to 16-bit) and BT.656/BT.1120 (8/16-bit)
	LPDDR/DDR2/3 Memory Controller	2 (32-bit Bus Widths)
	GPMC + ELM	Asynchronous (8-/16-bit bus width) RAM, NOR, NAND
	EDMA	64 Independent Channels 8 QDMA Channels
	10/100/1000 Ethernet MAC Switch with Management Data Input/Output (MDIO)	1 (with 2 MII/RMII/GMII/RGMII Interfaces)
	USB 2.0	2 (Supports High- and Full-Speed as a Device and High-, Full-, and Low-Speed as a Host, or OTG)
	PCI Express 2.0	1 Port (1 5.0GT/s lane)
	Timers	8 (32-bit General purpose) <b>and</b> 1 (System Watchdog)
	UART	6 (with SIR, MIR, FIR, CIR support and RTS/CTS flow control) (UART0 Supports Modem Interface)
	SPI	4 (Supports 4 slave devices)
	MMC/SD/SDIO	1 (1-bit or 4-bit or 8-bit modes) <b>and</b> 1 (8-bit mode) <b>or</b> 2 (1-bit or 4-bit modes)
	I2C	4 (Master/Slave)
	Media Controller	Controls HDVPSS and ISS
	McASP	6 (10/10/4/4/4/4 Serializers, Each with Transmit/Receive and DIT capability)
	McBSP	1 (2 Data Pins, Transmit/Receive)
	Controller Area Network (DCAN)	2
	Serial ATA (SATA) 3.0 Gbps	1 (Supports 1 Hard Disk Drive)
	RTC	1
	GPIO	Up to 128 pins
Parallel Camera Interface (CAM)	1	
Spin Lock Module	1 (up to 128 H/W Semaphores)	
Mailbox Module	1 (with 12 Mailboxes)	
On-Chip Memory	Size (Bytes)	768KB RAM, 48KB ROM
	Organization	<b>ARM</b> 32KB I-cache 32KB D-cache 512KB L2 Cache 64KB RAM 48KB Boot ROM

PRODUCT PREVIEW

## 2.3 Device Compatibility

## 2.4 ARM® Cortex™-A8 Microprocessor Unit (MPU) Subsystem Overview

The ARM® Cortex™-A8 Subsystem is designed to give the ARM Cortex-A8 Master control of the device. In general, the ARM Cortex-A8 is responsible for configuration and control of the various subsystems, peripherals, and external memories.

The ARM Cortex-A8 Subsystem includes the following features:

- ARM Cortex-A8 RISC processor:
  - ARMv7 ISA plus Thumb2™, JazelleX™, and Media Extensions
  - Neon™ Floating-Point Unit
  - Enhanced Memory Management Unit (MMU)
  - Little Endian
  - 32KB L1 Instruction Cache
  - 32KB L1 Data Cache
  - 512KB L2 Cache
- CoreSight Embedded Trace Module (ETM)
- ARM Cortex-A8 Interrupt Controller (AINTC)
- Embedded PLL Controller (PLL\_ARM)
- 64KB Internal RAM
- 48KB Internal Public ROM

Figure 2-1 shows the ARM Cortex-A8 Subsystem for the device.

Figure 2-1. ARM Cortex-A8 Subsystem

For more details on the ARM Cortex-A8 Subsystem, see the System MMU section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 2.4.1 ARM Cortex-A8 RISC Processor

The ARM Cortex-A8 Subsystem integrates the ARM Cortex-A8 processor. The ARM Cortex-A8 processor is a member of ARM Cortex family of general-purpose microprocessors. This processor is targeted at multi-tasking applications where full memory management, high performance, low die size, and low power are all important. The ARM Cortex-A8 processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug. The ARM Cortex-A8 processor has a Harvard architecture and provides a complete high-performance subsystem, including:

- ARM Cortex-A8 Integer Core
- Superscalar ARMv7 Instruction Set

- Thumb-2 Instruction Set
- Jazelle RCT Acceleration
- CP14 Debug Coprocessor
- CP15 System Control Coprocessor
- NEON™ 64-/128-bit Hybrid SIMD Engine for Multimedia
- Enhanced VFPv3 Floating-Point Coprocessor
- Enhanced Memory Management Unit (MMU)
- Separate Level-1 Instruction and Data Caches
- Integrated Level-2 Cache
- 128-bit Interconnector-to-System Memories and Peripherals
- Embedded Trace Module (ETM).

#### 2.4.2 Embedded Trace Module (ETM)

To support real-time trace, the ARM Cortex-A8 processor provides an interface to enable connection of an embedded trace module (ETM). The ETM consists of two parts:

- The Trace port which provides real-time trace capability for the ARM Cortex-A8.
- Triggering facilities that provide trigger resources, which include address and data comparators, counter, and sequencers.

The ARM Cortex-A8 trace port is not pinned out and is, instead, only connected to the system-level Embedded Trace Buffer (ETB). The ETB has a 32KB buffer memory. ETB enabled debug tools are required to read/interpret the captured trace data.

For more details on the ETM, see [Section 8.5.2, Trace](#).

#### 2.4.3 ARM Cortex-A8 Interrupt Controller (AINTC)

The ARM Cortex-A8 subsystem contains an interrupt controller (AINTC) that prioritizes all service requests from the system peripherals and generates either IRQ or FIQ to the ARM Cortex-A8 processor. For more details on the AINTC, see [Section 7.5.1, ARM Cortex-A8 Interrupts](#).

#### 2.4.4 ARM Cortex-A8 PLL (PLL\_ARM)

The ARM Cortex-A8 subsystem contains an embedded PLL Controller (PLL\_ARM) for generating the subsystem's clocks from the DEV Clock input. For more details on the PLL\_ARM, see [Section 7.4, Clocking](#).

#### 2.4.5 ARM MPU Interconnect

The ARM Cortex-A8 processor is connected through the arbiter to both an L3 interconnect port and a DMM port. The DMM port is 128-bits wide and provides the ARM Cortex-A8 direct access to the DDR memories, while the L3 interconnect port is 64-bits wide and provides access to the remaining device modules.

## 2.5 Media Controller Overview

The Media Controller has the responsibility of managing the HDVPSS and ISS modules.

For more details on the Media Controller, see the Media Controller Subsystem section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

## 2.6 SGX530 Overview

The SGX530 is a vector/3D graphics accelerator for vector and 3-dimensional (3D) graphics applications. The SGX530 graphics accelerator efficiently processes a number of various multimedia data types concurrently:

- Pixel data
- Vertex data
- Video data

This is achieved using a multi-threaded architecture using two levels of scheduling and data partitioning enabling zero overhead task switching.

The SGX530 has the following major features:

- Vector graphics and 3D graphics
- Tile-based architecture
- Universal Scalable Shader Engine (USSE™) - multi-threaded engine incorporating pixel and vertex shader functionality
- Advanced shader feature set - in excess of Microsoft VS3.0, PS3.0, and OpenGL2.0
- Industry standard API support - OpenGL ES 1.1 and 2.0, OpenVG v1.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry DMA driven operation for minimum CPU interaction
- Programmable high-quality image anti-aliasing
- POWERVR SGX core MMU for address translation from the core virtual address to the external physical address (up to 4GB address range)
- Fully-virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations [e.g., vector graphics, block level transfers (BLTs), raster operations (ROPs)]

For more details on the Secure State Machine (SSM), see the System MMU section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

## 2.7 Spinlock Module Overview

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- ARM Cortex-A8 processor
- Media Controller

The Spinlock module implements 128 spinlocks (or hardware semaphores) that provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need for a read-modify-write bus transfer of which the programmable cores are not capable.

For more details on the Spinlock Module, see the Spinlock section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

## 2.8 Mailbox Module Overview

The device Mailbox module facilitates communication between the ARM Cortex-A8 and the Media Controller. It consists of twelve mailboxes, each supporting a 1-way communication between two of the above processors. The sender sends information to the receiver by writing a message to the mailbox registers. Interrupt signaling is used to notify the receiver that a message has been queued or to notify the sender about an overflow situation.

The Mailbox module supports the following features (see [Figure 2-2](#)):

- 12 mailboxes
- Flexible mailbox-to-processor assignment scheme
- Four-message FIFO depth for each message queue
- 32-bit message width
- Message reception and queue-not-full notification using interrupts
- Three interrupts (one to ARM Cortex-A8 and two to Media Controller)

**Figure 2-2. Mailbox Module Block Diagram**

For more details on the Mailbox Module, see the Mailbox section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

## 2.9 Memory Map Summary

The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

### 2.9.1 L3 Memory Map

Table 2-3 shows the L3 memory map for all system masters (including Cortex-A8).

For more details on the interconnect topology and connectivity across the L3 and L4 interconnects, see Section 5, *System Interconnect*.

## 2.9.2 L4 Memory Map

The L4 Fast Peripheral Domain, L4 Slow Peripheral Domain regions of the memory maps above are broken out into [Table 2-4](#) and [Table 2-5](#).

For more details on the interconnect topology and connectivity across the L3 and L4 interconnects, see [Section 5, System Interconnect](#).

### 2.9.2.1 L4 Fast Peripheral Memory Map

### 2.9.3 DDR DMM TILER Extended Addressing Map

The Tiler includes an additional 4-GBytes of addressing range, enabled by a 33rd address bit, to access the frame buffer in rotated and mirrored views. shows the details of the Tiler Extended Address Mapping. This entirety of this additional range is only accessible to the HDVPSS and ISS subsystems. However, other masters can access any one single view through the 512-MB Tiler region in the base 4GByte address memory map.

**Table 2-6. DDR DMM TILER Extended Address Mapping**

BLOCK NAME	START ADDRESS (HEX)	END ADDRESS (HEX)	SIZE	DESCRIPTION
Tiler View 0	0x1 0000_0000	0x1 1FFF_FFFF	512MB	Natural 0° View
Tiler View 1	0x1 2000_0000	0x1 3FFF_FFFF	512MB	0° with Vertical Mirror View
Tiler View 2	0x1 4000_0000	0x1 5FFF_FFFF	512MB	0° with Horizontal Mirror View

### 3 Device Pins

#### 3.1 Pin Maps

Figure 3-1 through Figure 3-8 show the bottom view of the package pin assignments in eight pin maps (A, B, C, D, E, F, G, and H).

E	F	G	H

### 3.2 Terminal Functions

The terminal functions tables identify the external signal names and their pin multiplexing, the associated pin (ball) numbers along with the mechanical package designator, the pin type (e.g., I, O, Z, S, A, or GND), whether the pin has any internal pullup or pulldown resistors (e.g., IPU, IPD, or DIS), the supply voltage source, and describe the a function(s) of the pin. The **MUXED** column in the tables also identifies all peripheral pin functions multiplexed on a pin, the pin control register (PINCNTLx) that controls which peripheral pin function is selected for that particular pin, and indicates the state driven on the peripheral input (logic "0", logic "1", or "PIN" level) when the peripheral pin function is *not* selected (i.e., the de-selected input state [DSIS]), and the Multi-Muxed [MM] option for that peripheral pin function). For more detailed information on device configuration, boot mode order, peripheral selection, and multiplexed/shared pin control, etc., see [Section 4, Device Configurations](#) of this data manual.

### 3.2.1 Boot Configuration

**Table 3-1. Boot Configuration Terminal Functions**

SIGNAL NAME	NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2) (3)</sup>	MUXED	DESCRIPTION
<b>BOOT</b>					
GPMC_D[15]/ BTMODE[15]	Y25	I	DIS DVDD_GPMC	GPMC PINCNTL104 DSIS: PIN	<p><b>DESCRIPTION</b></p> <p>GPMC CS0 default GPMC_Wait enable input. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[15] is sampled to determine the GPMC CS0 Wait enable:</p> <ul style="list-style-type: none"> <li>0 = Wait disabled</li> <li>1 = Wait enabled</li> </ul> <p>After reset, this pin functions as GPMC multiplexed data/address pin 15 (GPMC_D[15]).</p>
GPMC_D[14]/ BTMODE[14]	V24	I	DIS DVDD_GPMC	GPMC PINCNTL103 DSIS: PIN	<p>GPMC CS0 default Address/Data multiplexing mode input. These pins are multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[14:13] are sampled to determine the GPMC CS0 Address/Data multiplexing:</p> <ul style="list-style-type: none"> <li>00 = Not muxed</li> <li>01 = A/A/D muxed</li> <li>10 = A/D muxed</li> <li>11 = Reserved</li> </ul> <p>After reset, this pin functions as GPMC multiplexed data/address pins 14 through 13 (GPMC_D[14:13]).</p>
GPMC_D[13]/ BTMODE[13]	U23	I	DIS DVDD_GPMC	GPMC PINCNTL102 DSIS: PIN	<p>GPMC CS0 default Data Bus Width input. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[12] is sampled to determine the GPMC CS0 bus width:</p> <ul style="list-style-type: none"> <li>0 = 8-bit data bus</li> <li>1 = 16-bit data bus</li> </ul> <p>After reset, this pin functions as GPMC multiplexed data/address pin 12 (GPMC_D[12]).</p>
GPMC_D[12]/ BTMODE[12]	U24	I	DIS DVDD_GPMC	GPMC PINCNTL101 DSIS: PIN	<p>RSTOUT_WD_OUT Configuration. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[11] is sampled to determine the function of the RSTOUT_WD_OUT pin:</p> <ul style="list-style-type: none"> <li>0 = RSTOUT is asserted when a Watchdog Timer reset, POR, RESET, or Emulation/Software-Global Cold/Warm reset occurs</li> <li>1 = RSTOUT_WD_OUT is asserted only when a Watchdog Timer reset occurs</li> </ul> <p>After reset, this pin functions as GPMC multiplexed data/address pin 11 (GPMC_D[11]).</p>
GPMC_D[11]/ BTMODE[11]	AA27	I	DIS DVDD_GPMC	GPMC PINCNTL100 DSIS: PIN

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see , *Pullup/Pulldown Resistors* and the , *Pin Behaviors at Reset*.

(3) Specifies the operating I/O supply voltage for each signal

### 3.2.13 PCI Express (PCIe)

**Table 3-24. PCI Express (PCIe) Terminal Functions**

SIGNAL NAME		NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2) (3)</sup>	DESCRIPTION
PCIE_TXP0	AD2	O	VDDA_PCIE_1P8	-	PCIE Transmit Data Lane 0.
PCIE_TXN0	AD1	O			When the PCIe SERDES are powered down, these pins should be left unconnected.
PCIE_RXP0	AC2	I	VDDA_PCIE_1P8	-	PCIE Receive Data Lane 0.
PCIE_RXN0	AC1	I			When the PCIe SERDES are powered down, these pins should be left unconnected.
SERDES_CLKP	AF1	I	SERDES_CLK LDO (internal)	-	PCIE Serdes Reference Clock Inputs and <i>optional</i> SATA Reference Clock Inputs. Shared between PCI Express and Serial ATA. When PCI Express is not used, and these pins are not used as <i>optional</i> SATA Reference Clock Inputs, these pins can be left unconnected.
SERDES_CLKN	AF2	I	SERDES_CLK LDO (internal)	-	

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
- (2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see , *Pullup/Pulldown Resistors* and , *Pin Behaviors at Reset*.
- (3) Specifies the operating I/O supply voltage for each signal

### 3.2.14 Reset, Interrupts, and JTAG Interface

**Table 3-25. RESET, Interrupts, and JTAG Terminal Functions**

SIGNAL NAME	NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2)</sup> (3)	MUXED	DESCRIPTION
<b>RESET</b>					
$\overline{\text{RESET}}$	J5	I	IPU DVDD	– PINCNTL260	Device Reset input
$\overline{\text{POR}}$	F1	I	– DVDD	–	Power-On Reset input
$\overline{\text{RSTOUT\_WD\_OUT}}$	K6	O	DIS DVDD	– PINCNTL262	Reset output (RSTOUT) or watchdog out (WD_OUT) For more detailed information on $\overline{\text{RSTOUT\_WD\_OUT}}$ pin behavior, see <a href="#">Section 7.3.14</a> , $\overline{\text{RSTOUT\_WD\_OUT}}$ Pin.
<b>INTERRUPTS</b>					
$\overline{\text{NMI}}$	H7	I	IPU DVDD	– PINCNTL261	Non-Maskable Interrupt input
GP0[31:0]	see <a href="#">Table 3-10</a>	I/O	see <b>NOTE</b>	see <a href="#">Table 3-10</a>	Interrupt-capable general-purpose I/Os. <b>NOTE:</b> All pins are multiplexed with other pin functions. See <a href="#">Table 3-10</a> , GP0 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP1[31:0]	see <a href="#">Table 3-11</a>	I/O	see <b>NOTE</b>	see <a href="#">Table 3-11</a>	Interrupt-capable general-purpose I/Os. <b>NOTE:</b> All pins are multiplexed with other pin functions. See <a href="#">Table 3-11</a> , GP1 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP2[31:0]	see <a href="#">Table 3-12</a>	I/O	see <b>NOTE</b>	see <a href="#">Table 3-12</a>	Interrupt-capable general-purpose I/Os. <b>NOTE:</b> All pins are multiplexed with other pin functions. See <a href="#">Table 3-12</a> , GP2 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP3[31:0]	see <a href="#">Table 3-13</a>	I/O	see <b>NOTE</b>	see <a href="#">Table 3-13</a>	Interrupt-capable general-purpose I/Os. <b>NOTE:</b> All pins are multiplexed with other pin functions. See <a href="#">Table 3-13</a> , GP3 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
<b>JTAG</b>					
TCLK	W7	I	IPU DVDD	–	JTAG test clock input
RTCK	AD4	O	IPU/DIS DVDD	–	JTAG return clock output The internal pullup (IPU) is enabled for this pin when the device is in reset and the IPU is disabled (DIS) when reset is released.
TDI	Y7	I	IPU DVDD	–	JTAG test data input
TDO	AC5	O	IPU DVDD	–	JTAG test port data output
TMS	AA7	I	IPU DVDD	–	JTAG test port mode select input. For proper operation, <b>do not</b> oppose the IPU on this pin.
$\overline{\text{TRST}}$	AA4	I	IPD DVDD	–	JTAG test port reset input
VOUT[0]_R_CR[2]/ <b>EMU4</b> / GP2[26]	AD9	I/O	IPD DVDD	VOUT[0], GP2 PINCNTL196 DSIS: PIN	Emulator pin 4
VOUT[0]_G_Y_YC[2]/ <b>EMU3</b> / GP2[24]	AH7	I/O	IPD DVDD	VOUT[0], GP2 PINCNTL188 DSIS: PIN	Emulator pin 3

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull during and after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Pullup/Pulldown Resistors](#) and [Pin Behaviors at Reset](#).

(3) Specifies the operating I/O supply voltage for each signal

**Table 3-25. RESET, Interrupts, and JTAG Terminal Functions (continued)**

SIGNAL NAME NO.		TYPE <sup>(1)</sup>	OTHER <sup>(2) (3)</sup>	MUXED	DESCRIPTION
VOUT[0]_B_CB_C[2]/ <b>EMU2</b> / GP2[22]	AG7	I/O	IPD DVDD	VOUT[0], GP0 PINCNTL180 DSIS: PIN	Emulator pin 2
EMU1	AE11	I/O	IPU DVDD	–	Emulator pin 1
EMU0	AG8	I/O	IPU DVDD	–	Emulator pin 0

**PRODUCT PREVIEW**

### 3.2.15 Serial ATA (SATA) Signals

**Table 3-26. Serial ATA (SATA) Terminal Functions**

SIGNAL NAME	NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2) (3)</sup>	MUXED	DESCRIPTION
SATA_TXN0	AB1	O	– VDDA_SATA_1P8	–	Serial ATA Data Transmit.
SATA_TXP0	AB2	O	– VDDA_SATA_1P8	–	When the SATA SERDES are powered down, these pins should be left unconnected.
SATA_RXN0	AA2	I	– VDDA_SATA_1P8	–	Serial ATA Data Receive.
SATA_RXP0	AA1	I	– VDDA_SATA_1P8	–	When the SATA SERDES are powered down, these pins should be left unconnected.
SPI[0]_SCS[1]/ SD1_SDCD/ <b>SATA_ACT0_LED</b> / EDMA_EVT1/ TIM4_IO/ GP1[6]	AE5	O	IPU DVDD	SPI[0], SD1, EDMA, TIMER 4, GP1 PINCNTL80 DSIS: N/A	Serial ATA disk 0 Activity LED output
SERDES_CLKP	AF1	I	– SERDES_CLK LDO (internal)	–	PCIE Serdes Reference Clock Inputs and <i>optional</i> SATA Reference Clock Inputs. Shared between PCI Express and Serial ATA. When PCI Express is not used, and these pins are not used as <i>optional</i> SATA Reference Clock Inputs, these pins should be left unconnected.
SERDES_CLKN	AF2	I	– SERDES_CLK LDO (internal)	–	PCIE Serdes Reference Clock Inputs and <i>optional</i> SATA Reference Clock Inputs. Shared between PCI Express and Serial ATA. When PCI Express is not used, and these pins are not used as <i>optional</i> SATA Reference Clock Inputs, these pins should be left unconnected.

- (1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
- (2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull during and after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see , *Pullup/Pulldown Resistors* and , *Pin Behaviors at Reset*.
- (3) Specifies the operating I/O supply voltage for each signal

### 3.2.16 SD Signals (MMC/SD/SDIO)

**Table 3-27. SD0 Terminal Functions**

SIGNAL NAME	NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2)</sup> (3)	MUXED	DESCRIPTION
SD0_CLK/ GP0[1]	Y6	O	IPU DVDD_SD	GP0 PINCNTL8 DSIS: 1	SD0 Clock output
SD0_CMD/ SD1_CMD/ GP0[2]	N1	O	IPU DVDD_SD	SD1, GP0 PINCNTL9 DSIS: 1	SD0 Command output
SD0_DAT[0]/ SD1_DAT[4]/ GP0[3]	R7	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL10 DSIS: PIN	SD0 Data0 I/O. Functions as data bit 0 for 4-/8-bit SD mode and single data bit for 1-bit SD mode.
SD0_DAT[1]_SDIRQ/ SD1_DAT[5]/ GP0[4]	Y5	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL11 DSIS: PIN	SD0 Data1 I/O. Functions as data bit 1 for 4-/8-bit SD mode and as an IRQ input for 1-bit SD mode.
SD0_DAT[2]_SDRW/ SD1_DAT[6]/ GP0[5]	Y3	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL12 DSIS: PIN	SD0 Data2 I/O. Functions as data bit 2 for 4-/8-bit SD mode and as a Read Wait input for 1-bit SD mode.
SD0_DAT[3]/ SD1_DAT[7]/ GP0[6]	Y4	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL13 DSIS: PIN	SD0 Data3 I/O. Functions as data bit 3 for 4-/8-bit SD mode.
MCA[1]_AXR[0]/ SD0_DAT[4]	V4	I/O	IPU DVDD	MCA[1] PINCNTL35 DSIS: PIN	SD0 Data4 I/O. Functions as data bit 4 for 8-bit SD mode.
MCA[1]_AXR[1]/ SD0_DAT[5]	T6	I/O	IPU DVDD	MCA[1], SC0 PINCNTL36 DSIS: PIN	SD0 Data5 I/O. Functions as data bit 5 for 8-bit SD mode.
MCA[2]_AXR[0]/ SD0_DAT[6]/ UART5_RXD/ GP0[12]	N2	I/O	IPU DVDD	MCA[2], UART5, GP0 PINCNTL41 DSIS: PIN	SD0 Data6 I/O. Functions as data bit 6 for 8-bit SD mode.
MCA[2]_AXR[1]/ SD0_DAT[7]/ UART5_TXD/ GP0[13]	V6	I/O	IPU DVDD	MCA[2], UART5, GP0 PINCNTL42 DSIS: PIN	SD0 Data7 I/O. Functions as data bit 7 for 8-bit SD mode.
UART0_CTS/ UART4_RXD/ DCAN1_TX/ SPI[1]_SCS[3]/ SD0_SDCD	AE6	I	IPD DVDD	UART0, UART4, DCAN1, SPI[1] PINCNTL72 DSIS: 1	SD0 Card Detect input

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see , *Pullup/Pulldown Resistors* and , *Pin Behaviors at Reset*.

(3) Specifies the operating I/O supply voltage for each signal

Table 3-28. SD1 Terminal Functions

SIGNAL NAME	NO.	TYPE <sup>(1)</sup>	OTHER <sup>(2)</sup> (3)	MUXED	DESCRIPTION

SIGNAL		TYPE <sup>(1)</sup>	OTHER	DESCRIPTION
NAME	NO.			
VREFSSTL_DDR[0]	G15	S		Reference Power Supply DDR[0]
VREFSSTL_DDR[1]	G14	S		Reference Power Supply DDR[1]
CVDD	K9, K10, K12, K18, L9, L10, L11, L12, L14, L15, L17, L19, M10, M12, M13, M14, M16, M18, N9, N13, N14, N17, N19, P12, P14, P16, R15, R17, R19, T12, U11, U13, U17, U19, W11	S		Variable Voltage Supply for the CORE_L Core Logic Voltage Domain For actual voltage supply ranges, see <a href="#">Section 6.2, Recommended Operating Conditions</a> .
CVDD_ARM	T14, T15, T16, U15, U16, V15, V16	S		Variable Voltage Supply for the ARM_L Core Logic Voltage Domain For actual voltage supply ranges, see <a href="#">Section 6.2, Recommended Operating Conditions</a> .
DVDD	M8, N7, P8, T7, U21, U22, V20, Y11, Y16, AA15, AA17, AB14, AB16	S		3.3 V/1.8 V Power Supply for General I/Os
DVDD_GPMC	K20, L21, M20	S		3.3 V/1.8 V Power Supply for GPMC I/Os
DVDD_GPMCB	P20, T20	S		3.3 V/1.8 V Power Supply for GPMCB I/Os
DVDD_SD	P7, P9	S		3.3 V/1.8 V Power Supply for MMC/SD/SDIO I/Os
DVDD_DDR[0]	E20, E21, G16, H16, H17, J15, J16, J17, J18	S		1.5 V/1.8 V Power Supply for DDR[0] I/Os
DVDD_DDR[1]	E8, E9, G13, H12, H13, H14, J10, J11, J13	S		1.5 V/1.8 V Power Supply for DDR[1] I/Os
DVDD_M	R10	S		1.8 V Power Supply . For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply.
DVDD_C	W19, W20	S		3.3 V/1.8 V Power Supply for Camera I/F I/Os
VDDA_ARMPLL_1P8	R13	S		1.8 V Analog Power Supply for PLL_ARM and PLL_SGX
VDDA_VID0PLL_1P8	AB18	S		1.8 V Analog Power Supply for PLL_VIDEO0
VDDA_VID1PLL_1P8	AA18	S		1.8 V Analog Power Supply for PLL_VIDEO1
VDDA_AUDIOPLL_1P8	R18	S		1.8 V Analog Power Supply for PLL_AUDIO
VDDA_DDRPLL_1P8	H15	S		1.8 V Analog Power Supply for PLL_DDR
VDDA_L3PLL_1P8	N18	S		1.8 V Analog Power Supply for PLL_L3, PLL_HDVPSS, and PLL_MEDIACTL

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

**Table 3-49. Supply Voltages Terminal Functions (continued)**

SIGNAL		TYPE <sup>(1)</sup>	OTHER	DESCRIPTION
NAME	NO.			
VDDA_PCIE_1P8	W9, W10	S		1.8 V Analog Power Supply for PCIe. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the PCIe is not being used.
VDDA_SATA_1P8	U9, U10	S		1.8 V Analog Power Supply for SATA. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the SATA is not being used.
VDDA_HDMI_1P8	W18	S		1.8 V Analog Power Supply for HDMI. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the HDMI is not being used.
VDDA_USB0_1P8	AA12	S		1.8 V Analog Power Supply for USB0. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the USB0 is not being used.
VDDA_USB1_1P8	W13	S		1.8 V Analog Power Supply for USB1. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the USB1 is not being used.
VDDA_VDAC_1P8	AB19	S		1.8 V Reference Power Supply for VDAC. For proper device operation, this pin <b>must</b> always be connected to a 1.8-V Power Supply, even if the VDAC is not being used.
VDDA_USB_3P3	AA13	S		3.3 V Analog Power Supply for USB0 and USB1. For proper device operation, this pin <b>must</b> always be connected to a 3.3-V Power Supply, even if USB0 and USB1 are not being used.
VDDA_1P8	L20, M7, M22, R20, U7, V10, W15, Y13	S		1.8 V Power Supply for on-chip LDOs and I/O biasing
LDOCAP_ARM	W14	A		ARM Cortex-A8 VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_ARMRAM	V14	A		ARM Cortex-A8 RAM LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM0	P18	A		CORE RAM0 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM1	R11	A		CORE RAM1 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM2	L18	A		CORE RAM2 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_SGX	T10	A		SGX530 VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_SERDESCLK	T11	A		SERDES_CLKP/N Pins LDO output. This pin must always be connected via a 1-uF capacitor to VSS.

PRODUCT PREVIEW

## 4 Device Configurations

### 4.1 Control Module Registers

### 4.2 Boot Modes

The state of the device after boot is determined by sampling the input states of the BTMODE[15:0] pins when device reset (POR or RESET) is de-asserted. The sampled values are latched into the CONTROL\_STATUS register, which is part of the Control Module. The BTMODE[15:11] values determine the following system boot settings:

- $\overline{\text{RSTOUT\_WD\_OUT}}$  Control
- GPMC CS0 Default Data Bus Width, Wait Enable, and Address/Data Multiplexing

For additional details on BTMODE[15:11] pin functions, see [Table 3-1, Boot Configuration Terminal Functions](#).

The BTMODE[4:0] values determine the boot mode order according to [Table 4-1, Boot Mode Order](#). The 1st boot mode listed for each BTMODE[4:0] configuration is executed as the primary boot mode. If the primary boot mode fails, the 2nd, 3rd, and 4th boot modes are executed in that order until a successful boot is completed.

The BTMODE[7:5] pins are RESERVED and should be pulled down as indicated in [Table 3-1, Boot Configuration Terminal Functions](#).

When the EMAC bootmode is selected (see [Table 4-1](#)), the sampled value from BTMODE[9:8] pins are used to determine the Ethernet PHY Mode selection (see [Table 4-7](#)).

When the XIP (MUX0), XIP (MUX1), XIP w/ WAIT (MUX0) or XIP w/ WAIT (MUX1) bootmode is selected (see [Table 4-1](#)), the sampled value from BTMODE[10] pin is used to select between GPMC pin muxing options shown in [Table 4-2, XIP \(on GPMC\) Boot Options \[Muxed or Non-Muxed\]](#).

For more detailed information on booting the device, see the *ROM Code Memory and Peripheral Booting* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

- (1) GPMC CS0 eExecute In Place (XIP) boot for NOR/OneNAND/ROM. MUX0/1 refers to the multiplexing option for the GPMC\_A[12:0] pins. For more detailed information on booting the device, including which pins are used for each boot mode, see the *ROM Code Memory and Peripheral Booting* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).
- (2) When the XIP (MUX0), XIP (MUX1), XIP w/ WAIT (MUX0) or XIP w/ WAIT (MUX1) bootmode is selected, the sampled value from BTMODE[10] pin is used to select between GPMC pin configuration options shown in [Table 4-2](#), *XIP (on GPMC) Boot Options*.
- (3) When the EMAC bootmode is selected, the sampled value from BTMODE[9:8] pins are used to determine the Ethernet PHY Mode Selection (see [Table 4-7](#)).
- (4) When the PCIe bootmode is selected (PCIE\_32 or PCI\_64), the sampled value from BTMODE[15:12] pins are used to determine the addressing options. For more detailed information on the PCIe addressing options, see the *ROM Code Memory and Peripheral Booting* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 4.2.1 XIP (NOR) Boot Options

[Table 4-2](#) shows the XIP (NOR) boot mode GPMC pin configuration options (Option A: BTMODE[10] = 0 and Option B: BTMODE[10] = 1). For Option B, the pull state on select pins is reconfigured to IPD and remains IPD after boot until the user software reconfigures it.

Table 4-2. XIP (on GPMC) Boot Options

### 4.2.2 NAND Flash Boot

Table 4-3 lists the device pins that are configured by the ROM for the NAND Flash boot mode.

NOTE: Table 4-3 lists the configuration of the GPMC\_CLK pin (pin mux and pull state) in NAND bootmodes.

The NAND flash memory is not XIP and requires shadowing before the code can be executed.

**Table 4-3. Pins Used in NAND FLASH Bootmode**

SIGNAL NAME	PIN NO.	TYPE	OTHER CONDITIONS
$\overline{\text{GPMC\_CS}}[0]^*$	T28	O	BTMODE[12] = 0b (8-bit Mode)
$\text{GPMC\_ADV\_ALE}^*$	M26	O	
$\overline{\text{GPMC\_OE\_RE}}$	T27	O	
$\text{GPMC\_BE}[0]_{\text{CLE}}/\text{GPMC\_A}[25]^*$	U27	O	BTMODE[12] = 1b (16-bit Mode)
$\text{GPMC\_BE}[1]/\text{GPMC\_A}[24]^*$	V28	O	BTMODE[14:13] = 00b (GPMC CS0 not muxed)
$\overline{\text{GPMC\_WE}}$	U28	O	
$\text{GPMC\_WAIT}[0]/\text{GPMC\_A}[26]^*(1)$	W28	I	
$\text{GPMC\_CLK}^*$	R26	O	BTMODE[15] = 0b (wait disabled)
$\text{GPMC\_D}[15:0]^*$	Y25,V24,U23,U24, AA27,Y26,AB28,Y2 7, V25,U25,AA28,V26 ,W27,V27,Y28,U26	I/O	

(1) GPMC\_CLK\* is not configured in BTMODE[10] = 1 [OPTION B]

### 4.2.3 NAND I2C Boot (I2C EEPROM)

Table 4-4 lists the device pins that are configured by the ROM for the NAND I2C boot mode.

**Table 4-4. Pins Used in NAND I2C Bootmode**

SIGNAL NAME	PIN NO.	TYPE
I2C[0]_SCL	AC4	I/O
I2C[0]_SDA	AB6	I/O

### 4.2.4 MMC/SD Cards Boot

Table 4-5 lists the device pins that are configured by the ROM for the MMC/SD boot mode.

**Table 4-5. Pins Used in MMC/SD Bootmode**

SIGNAL NAME	PIN NO.	TYPE
SD1_CLK	P3	O
SD1_CMD/GP0[0] [MUX0]	P2	O
SD1_DAT[0]	P1	I/O
SD1_DAT[1]_SDIRQ	P5	I/O
SD1_DAT[2]_SDRW	P4	I/O
SD1_DAT[3]	P6	I/O

#### 4.2.5 SPI Boot

Table 4-6 lists the device pins that are configured by the ROM for the SPI boot mode.

**Table 4-6. Pins Used in SPI Bootmode**

SIGNAL NAME	PIN NO.	TYPE
SPI[0]_SCS[0]	AD6	I/O
SPI[0]_D[0] (MISO)	AE3	I/O
SPI[0]_D[1] (MOSI)	AF3	I/O
SPI[0]_SCLK	AC7	I/O

#### 4.2.6 Ethernet PHY Mode Selection

When the EMAC bootmode is selected, via the BTMODE[4:0] pins (see Table 4-1), Table 4-7 shows the sampled value of BTMODE[9:8] pins and the Ethernet PHY Mode selection.

Table 4-8 shows the signal names (pin functions) and the associated pin numbers selected in each particular EMAC mode.

**Table 4-7. EMAC PHY Mode Selection**

BTMODE[9:8]	ETHERNET PHY MODE SELECTION
00b	MII
01b	RMII
10b	RGMII
11b	RESERVED

**Table 4-8. Pins Used in EMAC[0] MII/GMII, RGMII, and RMII Boot Modes**

#### 4.2.7 PCIe Bootmode (PCIE\_32 and PCIE\_64)

Table 4-9 lists the device pins that are configured by the ROM for the PCIe boot mode.

**Table 4-9. Pins Used in PCIe Bootmode**

SIGNAL NAME	PIN NO.	TYPE
PCIE_TXP0	AD2	O
PCIE_TXN0	AD1	O
PCIE_RXP0	AC2	I
PCIE_RXN0	AC1	I
SERDES_CLKIP	AF1	I
SERDES_CLKN	AF2	I

#### 4.2.8 UART Bootmode

Table 4-10 lists the device pins that are configured by the ROM for the UART boot mode.

**Table 4-10. Pins Used in UART Bootmode**

SIGNAL NAME	PIN NO.	TYPE
UART0_RXD	AH5	I
UART0_TXD	AG5	O

### 4.3 Pin Multiplexing Control

Device level pin multiplexing is controlled on a pin-by-pin basis by the MUXMODE bits of the PINCNTL1 – PINCNTL270 registers in the Control Module.

Pin multiplexing selects which one of several peripheral pin functions controls the pin's I/O buffer output data values. [Table 4-11](#) shows the peripheral pin functions associated with each MUXMODE setting for all multiplexed pins. The default pin multiplexing control for almost every pin is to select MUXMODE = 0x0, in which case the pin's I/O buffer is 3-stated.

In most cases, the input from each pin is routed to all of the peripherals that share the pin, regardless of the MUXMODE setting. However, in some cases a constant "0" or "1" value is routed to the associated peripheral when its peripheral function is not selected to control any output pin. For more details on the De-Selected Input State (DSIS), see the "MUXED" columns of each Terminal Functions table ([Section 3.2, Terminal Functions](#)).

Some peripheral pin functions can be routed to more than one device pin. These types of peripheral pin functions are called Multimuxed (MM) and may have different Switching Characteristics and Timing Requirements for each device pin option. The Multimuxed peripheral pin functions are labeled as "MM" in Terminal Functions tables in [Section 3.2, Terminal Functions](#) and the associated timings for each MM pin option are in [Section 8, Peripheral Information and Timings](#).

- (1) "(M0)" represents multimuxed option "0" for this pin function, "(M1)" represents multimuxed option "1" for this pin function, ... etc.
- (2) Within this MUXMODE setting, EMAC[x] GMII or RGMII pin functions are selected via the RGMII0\_EN and/or RGMII1\_EN bits (8 and 9, respectively) in the GMII\_SEL register [0x4814\_0650] of the Control Module. "0" = GMII (default) and "1" = RGMII.

Table 4-11. PINCNTLx Registers MUXMODE Functions

HEX ADDRESS	REGISTER NAME	PIN NO.	MUXMODE[7:0] SETTINGS <sup>(1)</sup>

PRODUCT PREVIEW

## 4.4 Handling Unused Pins

When device signal pins are unused in the system, they can be left unconnected unless otherwise noted in the Terminal Functions tables (see [Section 3.2](#)). For unused input pins, the internal pull resistor should be enabled, or an external pull resistor should be used, to prevent floating inputs. All supply pins must always be connected to the correct voltage, even when their associated signal pins are unused.

## 4.5 DeBugging Considerations

### 4.5.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the AM387x Sitara™ ARM Processors (MPUs) device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot Configuration Pins:* If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is **strongly recommended**, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins:* If the IPU/IPD *does not* match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the boot configuration pins (listed in [Table 3-1, Boot Configuration Terminal Functions](#)), if they are both routed out and 3-stated (not driven), it is **strongly recommended** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest  $V_{IL}$  level of all inputs connected to the net. For a pullup resistor, this should be above the highest  $V_{IH}$  level of all inputs on the net. A reasonable choice would be to target the  $V_{OL}$  or  $V_{OH}$  levels for the logic family of the limiting device; which, by definition, have margin to the  $V_{IL}$  and  $V_{IH}$  levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the  $DV_{DD}$  rail.

For most systems, a 1-k $\Omega$  resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k $\Omega$  resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k $\Omega$  resistor can also be used as an external PU/PD on the pins that have IPU/IPDs disabled and require an external PU/PD resistor while still meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current ( $I_I$ ), and the low-/high-level input voltages ( $V_{IL}$  and  $V_{IH}$ ) for the device, see [Section 6.3](#), *Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature*.

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

## 5 System Interconnect

The device's various processors, subsystems, and peripherals are interconnected through a switch fabric architecture. The switch fabric is composed of an L3 and L4 interconnect, a switched central resource (SCR), and multiple bridges (for an overview, see [Figure 5-1](#)). Not all Initiators in the switch fabric are connected to all Target peripherals. The supported initiator and target connections are designated by a "X" in [Table 5-1](#), *Target/Initiator Connectivity*.

For more detailed information on the device System Interconnect Architecture, see the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

The L4 interconnect is a non-blocking peripheral interconnect that provides low-latency access to a large number of low-bandwidth, physically-dispersed target cores. The L4 can handle incoming traffic from up to four initiators and can distribute those communication requests to and collect related responses from up to 63 targets.

The device provides two interfaces with L3 interconnect for high-speed peripheral and standard peripheral.

## 6 Device Operating Conditions

### 6.1 Absolute Maximum Ratings <sup>(1)(2)</sup>

Supply voltage ranges (Steady State):	Core (CVDD, CVDD_ARM)	-0.3 V to 1.5 V
	I/O, 1.8 V (DVDD_M, DVDD_DDR[0], DVDD_DDR[1], VDDA_1P8, VDDA_ARMPLL_1P8, VDDA_VID0PLL_1P8, VDDA_VID1PLL_1P8, VDDA_AUDIOPLL_1P8, VDDA_DDRPLL_1P8, VDDA_L3PLL_1P8, VDDA_PCIE_1P8, VDDA_SATA_1P8, VDDA_HDMI_1P8, VDDA_USB0_1P8, VDDA_USB1_1P8, VDDA_VDAC_1P8)	-0.3 V to 2.1 V
	I/O 3.3 V (DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C)	-0.3 V to 4.0 V
	DDR Reference Voltage (VREFSSTL_DDR[0], VREFSSTL_DDR[1])	-0.3 V to 1.1 V
Input and Output voltage ranges:	V I/O, 1.5-V pins (Steady State)	-0.3 V to DVDD_DDR[x] + 0.3 V
	V I/O, 1.5-V pins (Transient Overshoot/Undershoot)	30% of DVDD_DDR[x] for up to 30% of the signal period
	V I/O, 1.8-V pins (Steady State)	-0.3 V to DVDD + 0.3 V -0.3 V to DVDD_x + 0.3 V
	V I/O, 1.8-V pins (Transient Overshoot/Undershoot)	30% of DVDDx for up to 30% of the signal period
	V I/O, 3.3-V pins (Steady State)	-0.3 V to DVDD + 0.3 V -0.3 V to DVDD_x + 0.3 V
	V I/O, 3.3-V pins (Transient Overshoot/Undershoot)	30% of DVDDx for up to 30% of the signal period
Operating junction temperature range, T <sub>j</sub> :	Commercial Temperature	0°C to 90°C
	Industrial	-40°C to 90°C
	Extended	-40°C to 105°C
Storage temperature range, T <sub>stg</sub> :		-55°C to 150°C
Electrostatic Discharge (ESD) Performance:	ESD-HBM (Human Body Model) <sup>(3)</sup>	±2000 V
	ESD-CDM (Charged-Device Model) <sup>(4)</sup>	±500 V
	ESD-CDM (Charged-Device Model) Corner Balls (A1, A28, AH1, AH28) <sup>(4)</sup>	±750 V

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to their associated VSS or VSSA\_x.
- (3) Based on JEDEC JESD22-A114E [Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)].
- (4) Based on JEDEC JESD22-C101C (Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components).

ICVDD_ARM	ARM Core Current (Scalable)			TBD		mA

- (1) For test conditions shown as MIN, MAX, or TYP, use the appropriate value specified in the recommended operating conditions table.
- (2) LVCMOS pins are all I/O pins powered by DVDD, DVDD\_GPMC, DVDD\_GPMCB, DVDD\_SD, DVDD\_C supplies except for I2C[0] and I2C[1] pins.
- (3) I<sub>I</sub> applies to input-only pins and bi-directional pins. For input-only pins, I<sub>I</sub> indicates the input leakage current. For bi-directional pins, I<sub>I</sub> indicates the input leakage current and off-state (Hi-Z) output leakage current.
- (4) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
- (5) I<sub>OZ</sub> applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
- (6) Measured under the following conditions: TBD. The actual current draw varies across manufacturing processes and is highly application-dependent. For more details on core and I/O activity, as well as information relevant to board power supply design, see the AM387x Power Consumption Summary Application Report (Literature Number: TBD).

**PRODUCT PREVIEW**

## 7 Power, Reset, Clocking, and Interrupts

### 7.1 Power, Reset and Clock Management (PRCM) Module

The PRCM module is the centralized management module for the power, reset, and clock control signals of the device. It interfaces with all the components on the device for power, clock, and reset management through power-control signals. It integrates enhanced features to allow the device to adapt energy consumption dynamically, according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The PRCM module is composed of two main entities:

- Power reset manager (PRM): Handles the power, reset, wake-up management, and system clock source control (oscillator)
- Clock manager (CM): Handles the clock generation, distribution, and management.

For more details on the PRCM, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.2 Power

#### 7.2.1 Voltage and Power Domains

Every Module within the device belongs to a Core Logic Voltage Domain, Memory Voltage Domain, and a Power Domain (see [Table 7-1](#)).

**Table 7-1. Voltage and Power Domains**

CORE LOGIC VOLTAGE DOMAIN	MEMORY VOLTAGE DOMAIN	POWER DOMAIN	MODULE(S)	
ARM_L	ARM_M	ALWAYS ON	ARM Cortex-A8 Subsystem, SmartReflex Sensor 0	
CORE_L	CORE_M		DCAN0/1, DMM, EDMA, ELM, DDR0/1, EMAC Switch, GPIO Banks 0/1/2/3, GPMMC, I2C0/1/2/3, IPC, MCASP0/1/2/3/4/5, MCBSP, OCMC SRAM, PCIE, PRCM, RTC, SATA, SD/MMC0/1/2, SPI0/1/2/3, Timer1/2/3/4/5/6/7/8, UART0/1/2/3/4/5, USB0/1, WDT0, System Interconnect, JTAG, Media Controller, ISS, SmartReflex Control Module 0/1, SmartReflex Sensor 1	
			GFX	SGX530
			HDVPSS	HDVPSS, HDMI, SD-DAC

##### 7.2.1.1 Core Logic Voltage Domains

The device contains four Core Logic Voltage Domains. These domains define groups of Modules that share the same supply voltage for their core logic. Each Core Logic Voltage Domain is powered by a dedicated supply voltage rail that can be independently scaled using SmartReflex technology to trade off power versus performance. [Table 7-2](#) shows the mapping between the Core Logic Voltage Domains and their associated supply pins.

**Table 7-2. Core Logic Voltage Domains and Supply Pin Associations**

CORE LOGIC VOLTAGE DOMAIN	SUPPLY PIN NAME
ARM_L	CVDD_ARM
CORE_L	CVDD

**Note:** A regulated supply voltage *must* be supplied to each Core Logic Voltage Domain at all times, regardless of the Core Logic Power Domain states.

### 7.2.1.2 Memory Voltage Domains

The SRAM within each Device Module is assigned to one of four Memory Voltage Domains. The voltage of each Memory Voltage Domain is independently controlled by internal LDO regulators, which are supplied by the VDDA\_1P8 pins.

The voltage level output by each of these LDO regulators is controlled through software by programming the RAMLDO\_CTRLx registers in the Control Module. The Memory Voltage Domain voltage must be programmed based on the Core Logic Voltage Domain voltage for that domain (i.e., the corresponding Core Logic Voltage Domain for the ARM\_M Voltage Domain is ARM\_C, etc). [Table 7-3](#) shows the Memory Voltage Domain voltage requirements.

**Table 7-3. Memory Voltage Domain LDO Requirements**

CORE LOGIC VOLTAGE DOMAIN VOLTAGE (V)	MEMORY VOLTAGE DOMAIN VOLTAGE (V)
0.83 – 1.20	1.20

### 7.2.1.3 Power Domains

The device contains six Power Domains which supply power to both the Core Logic and SRAM within their associated modules. Each Power Domain, except for the ALWAYS ON domain, has an internal power switch that can completely remove power from that domain. All power switches are turned "OFF" by default after reset, and software can individually turn them "ON/OFF" via Control Module registers.

*Note:* All Modules within a Power Domain are unavailable when the domain is powered "OFF". For instructions on powering "ON/OFF" the Power domains, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

## 7.2.2 SmartReflex™

The device contains SmartReflex modules that help to minimize power consumption on the Core Logic Voltage Domains by using external variable-voltage power supplies. Based on the device process, temperature, and desired performance, the SmartReflex modules advise the host processor to raise or lower the supply voltage to each domain for minimal power consumption.

The communication link between the host processor and the external regulators is a system-level decision and can be accomplished using GPIOs, I2C, SPI, or other methods. The following sections briefly describe the two major techniques employed by SmartReflex: Dynamic Voltage Frequency Scaling (DVFS) and Adaptive Voltage Scaling (AVS).

For specifics on implementing the SmartReflex techniques, see the *DM814x SmartReflex Application Report* (Literature Number: SPRTBD).

### 7.2.2.1 Dynamic Voltage Frequency Scaling (DVFS)

Each device Core Logic Voltage Domain can be run independently at one of several Operating Performance Points (OPPs). An OPP for a specific Core Logic Voltage Domain is defined by: (1) maximum frequencies of operation for Modules within the Domain and (2) an associated supply voltage range. Trading off power versus performance, OPPs with lower maximum frequencies also have lower voltage ranges for power savings.

The OPP for a domain can be changed in real-time without requiring a reset. This feature is called Dynamic Voltage Frequency Scaling (DVFS). For detailed procedures on implementing DVFS, see the *DM814x SmartReflex* Application Report (Literature Number: SPRTBD). [Table 7-4](#) contains a list of voltage ranges and maximum module frequencies for the OPPs of each Core Logic Voltage Domain.

**Table 7-4. Device Operating Points (OPPs)**

OPP	CORE LOGIC VOLTAGE DOMAINS						
	ARM	CORE					
	Cortex A8 (MHz)	HDVPSS (MHz)	SGX (MHz)	ISS (MHz)	Media Ctr. (MHz)	L3/L4, Core (MHz)	DDR (MHz) <sup>(1)</sup>
50% <sup>(2)</sup>	300	TBD	TBD	TBD	TBD	TBD	TBD
100%	600	200	200	400	200	200	400
120%	720	220	250	400	200	220	400
166%	800	TBD	TBD	TBD	TBD	TBD	TBD
	1000	TBD	TBD	TBD	TBD	TBD	TBD

(1) All DDR access **must** be suspended prior to changing the DDR frequency of operation.

(2) OPP 50% does not support all CORE peripherals (e.g., EMAC GMII/RGMII, USB2.0, PCIe, SD-DAC, SATA, TBD are not supported).

Although the OPP for each Core Logic Voltage Domain is independently selectable, not all combinations of OPPs are supported. marks the supported ARM OPPs for a given CORE OPP.

**Table 7-5. Supported OPP Combinations<sup>(1)(2)</sup>**

CORE	ARM			
	OPP166	OPP120	OPP100	OPP50
OPP166	TBD	TBD		
OPP120	TBD	X	X	
OPP100		X	X	X
OPP50				X

(1) "X" denotes supported combinations.

(2) The maximum voltage differences between CVDD and any other CVDD\_x voltage domain **must** be < 150 mV.

### 7.2.2.2 Adaptive Voltage Scaling

As mentioned in [Section 7.2.2.1, Dynamic Voltage Frequency Scaling \(DVFS\)](#) above, every OPP has an associated voltage range. Based on the silicon process, temperature, and chosen OPP, the SmartReflex modules guide software in adjusting the Core Logic Voltage Domain supply voltages within these ranges. This technique is called Adaptive Voltage Scaling (AVS). AVS occurs continuously and in real-time, helping to minimize power consumption in response to changing operating conditions. For detailed procedures on implementing AVS, see the *DM814x SmartReflex* Application Report (Literature Number: SPRTBD).

### 7.2.3 Memory Power Management

In order to reduce SRAM leakage, many SRAM blocks can be switched from ACTIVE mode to SHUTDOWN mode. When SRAM is put in SHUTDOWN mode, the voltage supplied to it is automatically removed and all data in that SRAM is lost.

All SRAM located in a switchable power domain (all domains except ALWAYS\_ON) automatically enters SHUTDOWN mode whenever its associated power domain goes into the "OFF" state. The SRAM returns to the ACTIVE state when the corresponding Power Domain returns to the "ON" state.

In addition, the following SRAM within the ALWAYS\_ON Power Domain can also be independently put into SHUTDOWN by programming the x\_MEM\_PWRDN registers in the Control Module:

- Media Controller SRAM
- OCMC SRAM

For detailed instructions on powering up/down the various device SRAM, see the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 7.2.4 SERDES\_CLKP/N LDO

The SERDES\_CLKP/N input buffers are powered by an internal LDO which is programmed through the REFCLK\_LJCBLDO\_CTRL register in the Control Module.

For more information on programming the SERDES\_CLKN/P LDO, see *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 7.2.5 Dual Voltage I/Os

The device supports dual voltages on some of its I/Os. These I/Os are partitioned into the following groups, and each group has its own dedicated supply pins: DVDD, DVDD\_GPMC, DVDD\_C, DVDD\_SD, and DVDD\_M. The supply voltage for each group can be independently powered with either 1.8 V or 3.3 V.

For the mapping between pins and power groups, see [Section 3.2, Terminal Functions](#) of the datasheet.

In addition, the I/O voltage on each DDR interface is independently selectable between either 1.5 V or 1.8 V to support various DDR device types. The I/O supplies for each DDR interface are separate and isolated to allow populating different memory types on each interface.

#### 7.2.6 I/O Power-Down Modes

On the device, there are power-down modes available for the following PHYs:

- Video DAC
- DDR
- USB
- HDMI
- PCIE
- SATA

When a PHY controller is in a power domain that is to be turned "OFF", software must configure the corresponding PHY into power-down mode, prior to putting the power domain in the "OFF" state.

## 7.2.7 Standby and Deep Sleep Modes

The device supports Low-Power Standby and Deep-Sleep Modes as described below.

**Standby Mode** is defined as a state in which:

- All switchable power domains are in "OFF" state
- The ARM Cortex-A8 is executing an IDLE loop at its lowest frequency of operation
- All functional blocks not needed for a given application are clock gated

**Deep Sleep Mode** is defined to be the same as Standby Mode, with the addition of gating the crystal oscillator to further eliminate all active power. The device core voltages can be reduced to 0.83 V for optimal power savings.

For detailed instructions on entering and exiting from Standby and Deep Sleep Modes, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

## 7.2.8 Supply Sequencing

The device power supplies are organized into four Supply Sequencing Groups:

1. All CVDD supplies (CVDD, CVDD\_x)
2. All 1.5-V Supplies (DVDD\_DDR[x] at 1.5 V [only needed if using DDR3])
3. All 1.8-V Supplies (DVDD\_x, DVDD\_M, DVDD\_DDR[x] at 1.8 V [if using LPDDR, DDR2], VDDA\_x\_1P8, VDDA\_1P8)
4. All 3.3-V Supplies (DVDD, DVDD\_x, DVDD\_C, VDDA\_x\_3P3)

To ensure proper device operation, a specific power-up and power-down sequence must be followed. Some TI power-supply devices include features that facilitate these power sequencing requirements — for example, TI's TPS659113 integrated PMIC. For more information on TI power supplies and their features, visit [www.ti.com/processorpower](http://www.ti.com/processorpower).

For more detailed information on the actual power supply names and their descriptions, see [Table 3-49, Supply Voltages Terminal Functions](#).

### 7.2.8.1 Power-Up Sequence

For proper device operation, the following power-up sequence in [Table 7-6](#) and [Figure 7-1](#) **must** be followed.

**Table 7-6. Power-Up Sequence Ramping Values**

NO.	DESCRIPTION	MIN	MAX	UNIT
1	1.8 V supplies to 3.3 V supplies	(1)		ms
2	1.8 V supplies to 1.5 V (DVDD_DDR[x]) supplies	0 <sup>(2)</sup>		ms
3	1.8 V supplies stable to CVDD, CVDD_x supplies ramp start	0 <sup>(2)</sup>		ms
4	All supplies valid to power-on-reset ( $\overline{\text{POR}}$ high)	4 096		Master Clocks

(1) The 3.3 V supplies **must** never be more than 2 V above the 1.8 V supplies (see [Figure 7-2](#)).

(2) The 1.8 V supplies **must** be  $\geq 1.5$  V (DVDD\_DDR[x]) and CVDD, CVDD\_x supplies.

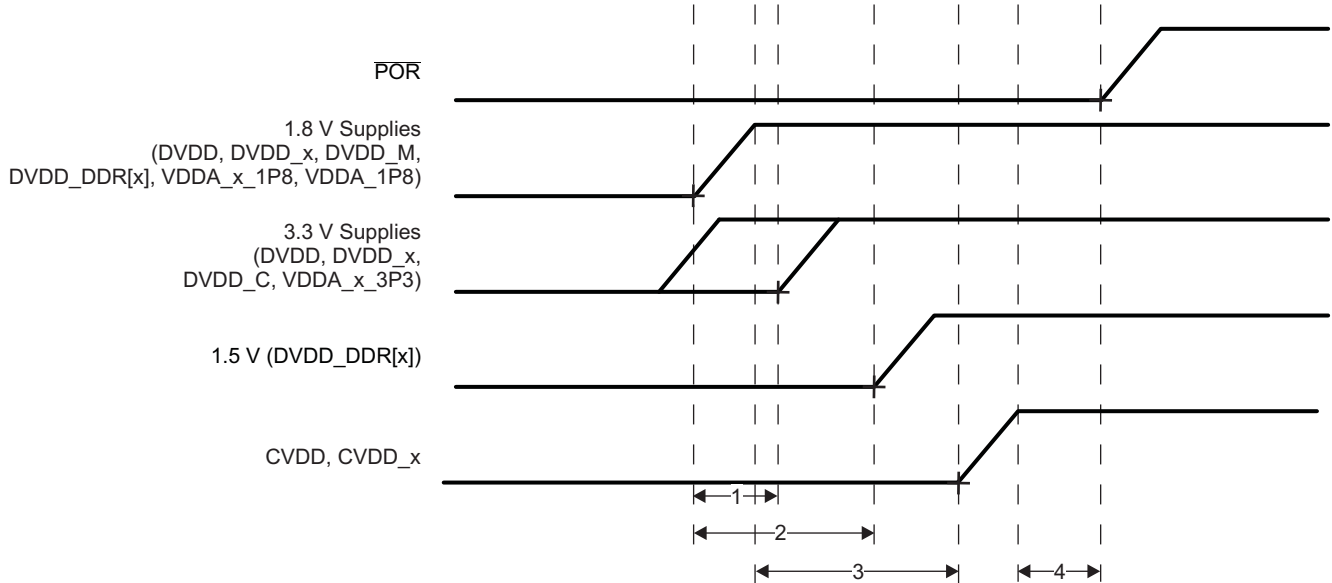

Figure 7-1. Power-Up Sequence

Figure 7-2. 3.3 V Supplies Rising Before 1.8 V Supplies Delta

### 7.2.8.2 Power-Down Sequence

For proper device operation, the following power-down sequence in [Table 7-7](#) and [Figure 7-3](#) **must** be followed.

Table 7-7. Power-Down Sequence Ramping Values

NO.	DESCRIPTION	MIN	MAX	UNIT
5	CVDD, CVDD_x supplies to 1.8 V supplies	(1)	(1)	ms
6	1.5 V (DVDD_DDR[x]) supplies to 1.8 V supplies	(1)	(1)	ms
7	3.3 V supplies to 1.8 V supplies	(2)	(2)	ms

(1) The 1.8 V supplies **must** be  $\geq 1.5$  V (DVDD\_DDR[x]) and CVDD, CVDD\_x supplies.

(2) The 3.3 V supplies **must** never be more than 2 V above the 1.8 V supplies (see [Figure 7-2](#)).

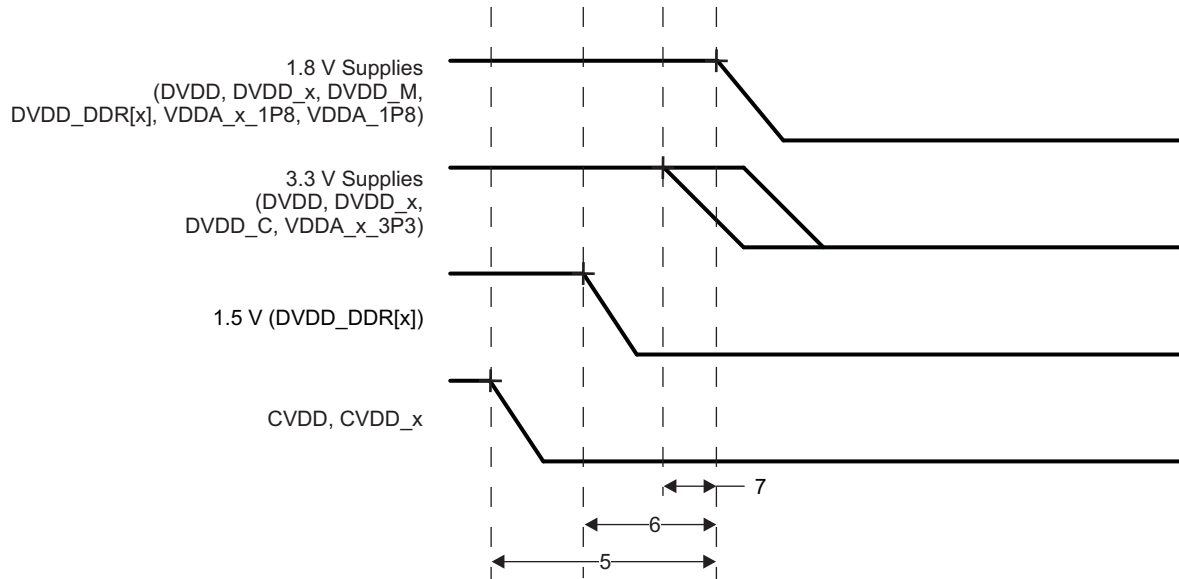

Figure 7-3. Power-Down Sequence

## 7.2.9 Power-Supply Decoupling

### 7.2.9.1 Analog and PLL

PLL and Analog supplies benefit from filters or ferrite beads to keep the noise from causing problems. The minimum recommendation is a ferrite bead along with at least one capacitor on the device side of the bead. An additional recommendation is to add one capacitor just before the bead to form a Pi filter. The filter needs to be as close as possible to the device pin, with the device side capacitor being the most important component to be close to the device pin. PLL pins close together can be combined on the same supply, but analog pins should all have their own filters. PLL pins farther away from each other may need their own filtered supply.

### 7.2.9.2 Digital

Recommended capacitors for power supply decoupling are all 0.1µF in the smallest body size that can be used. Capacitors are more effective in the smallest physical size to limit lead inductance. For example, 0201 sized capacitors are better than 0402 sized capacitors, and so on. TI recommends using capacitors no larger than 0402. Place at least one capacitor for every two power pins. For those power pins that have only one pin, a capacitor is still required. Place one bulk (10 µF or larger) capacitor for every 10 or so power pins as closely as possible to the chip. These larger caps do not need to be under the chip footprint.

Pay special attention not to put so much capacitance on the supply that it slows the start-up voltage ramp enough to change the power sequencing order. Also be sure to verify that the main chip reset is low until after all supplies are at their correct voltage and stable.

DDR peripheral related supply capacitor numbers are provided in [Section 8.13, LPDDR/DDR2/DDR3 Memory Controller](#).

## 7.3 Reset

### 7.3.1 System-Level Reset Sources

The device has several types of system-level resets. [Table 7-8](#) lists these reset types, along with the reset initiator, and the effects of each reset on the device.

**Table 7-8. System-Level Reset Types**

TYPE	INITIATOR	RESETS ALL MODULES, EXCLUDING EMAC SWITCH, EMULATION, PLL AND CLOCK CONFIG	RESETS EMAC SWITCH	RESETS EMULATION	PLL AND CLOCK CONFIG	LATCHES BOOT PINS	ASSERTS RSTOUT_WD_OUT PIN
Power-on Reset (POR)	$\overline{\text{POR}}$ pin	Yes	Yes	Yes	Yes	Yes	Optional <sup>(1)(2)</sup>
External Warm Reset	RESET pin	Yes	Optional <sup>(3)</sup>	No	No	Yes	Optional <sup>(1)(2)</sup>
Emulation Warm Reset	On-Chip Emulation Logic	Yes	Optional <sup>(3)</sup>	No	No	No	Optional <sup>(1)</sup>
Watchdog Reset	Watchdog Timer	Yes	Optional <sup>(3)</sup>	No	No	No	Yes
Software Global Cold Reset	Software	Yes	Optional <sup>(3)</sup>	Yes	Yes	No	Optional <sup>(1)</sup>
Software Global Warm Reset	Software	Yes	Optional <sup>(3)</sup>	No	No	No	Optional <sup>(1)</sup>
Test Reset	TRST pin	No	No	Yes	No	No	No

- (1) RSTOUT\_WD\_OUT pin asserted only if BTMODE[11] was latched as "0" when coming out of reset.
- (2) While POR and/or RESET is asserted, the RSTOUT\_WD\_OUT pin is 3-stated and the internal pull resistor is disabled; therefore, an external pullup/pulldown can be used to set the state of this pin (high/low) while  $\overline{\text{POR}}$  and/or RESET is asserted. For more detailed information on external PUs/PDs, see , *Pullup/Pulldown Resistors*.
- (3) EMAC Switch is NOT reset when the ISO\_CONTROL bit in the RESET\_ISO Control Module register is set to "1".

### 7.3.2 Power-on Reset ( $\overline{\text{POR}}$ pin)

Power-on Reset (POR) is initiated by the  $\overline{\text{POR}}$  pin and is used to reset the entire chip, including the Test and Emulation logic, and the EMAC Switch.  $\overline{\text{POR}}$  is also referred to as a cold reset since it is required to be asserted when the device goes through a power-up cycle. However, a device power-up cycle is not required to initiate a Power-on Reset.

The following sequence **must** be followed during a Power-on Reset:

1. Wait for the power supplies to reach normal operating conditions while keeping the  $\overline{\text{POR}}$  pin asserted.
2. Wait for the input clock sources DEV\_CLKIN, AUX\_CLKIN, and SERDES\_CLKN/P to be stable (if used by the system) while keeping the  $\overline{\text{POR}}$  pin asserted (low).
3. Once the power supplies and the input clock sources are stable, the  $\overline{\text{POR}}$  pin must remain asserted (low) [see [Section 7.3.18](#), *Reset Electrical Data/Timing*]. Within the low period of the  $\overline{\text{POR}}$  pin, the following happens:
  - (a) All pins except Emulation pins enter a Hi-Z mode and the associated pulls, if applicable, will be enabled.
  - (b) The PRCM asserts reset to all modules within the device.
  - (c) The PRCM begins propagating these clocks to the chip with the PLLs in BYPASS mode.
4. The  $\overline{\text{POR}}$  pin may now be de-asserted (driven high). When the  $\overline{\text{POR}}$  pin is de-asserted (high):
  - (a) The BTMODE[15:0] pins are latched.
  - (b) Reset to the ARM Cortex-A8 and Modules without a local processor is de-asserted.
  - (c) RSTOUT\_WD\_OUT is briefly asserted if BTMODE[11] was latched as "0".
  - (d) The clock, reset, and power-down state of each peripheral is determined by the default settings of the PRCM.
  - (e) The ARM Cortex-A8 begins executing from the Boot ROM.

### 7.3.3 External Warm Reset ( $\overline{\text{RESET}}$ pin)

An external warm reset is activated by driving the  $\overline{\text{RESET}}$  pin active-low. This resets everything in the device, except for the Test and Emulation logic, and the EMAC Switch (optional). An emulator session stays alive during warm reset.

The following sequence **must** be followed during a warm reset:

1. Power supplies and input clock sources should already be stable.
2. The  $\overline{\text{RESET}}$  pin must be asserted (low)[see [Section 7.3.18, Reset Electrical Data/Timing](#)]. Within the low period of the  $\overline{\text{RESET}}$  pin, the following happens:
  - (a) All pins, except Test and Emulation pins, enter a Hi-Z mode and the associated pulls, if applicable, will be enabled.
  - (b) The PRCM asserts reset to all modules within the device, except for the Test and Emulation logic, EMAC Switch (optional), PLL, and Clock configuration.
3. The  $\overline{\text{RESET}}$  pin may now be de-asserted (driven high). When the  $\overline{\text{RESET}}$  pin is de-asserted (high):
  - (a) The BTMODE[15:0] pins are latched.
  - (b) Reset to the ARM Cortex-A8 and modules without a local processor is de-asserted, with the exception of Test and Emulation logic, EMAC Switch (optional), PLL, and Clock configuration.
  - (c)  $\overline{\text{RSTOUT\_WD\_OUT}}$  is asserted [see [Section 7.3.18, Reset Electrical Data/Timing](#)], if BTMODE[11] was latched as "0".
  - (d) The clock, reset, and power-down state of each peripheral is determined by the default settings of the PRCM.
  - (e) The ARM Cortex-A8 begins executing from the Boot ROM.

### 7.3.4 Emulation Warm Reset

An Emulation Warm Reset is activated by the on-chip Emulation Module. It has the same effect and requirements as an External Warm Reset ( $\overline{\text{RESET}}$ ), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- $\overline{\text{RSTOUT\_WD\_OUT}}$  is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

The emulator initiates an Emulation Warm Reset via the ICEPICK module. To invoke the Emulation Warm Reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Target -> Reset -> System Reset.

### 7.3.5 Watchdog Reset

A Watchdog Reset is initiated when the Watchdog Timer counter reaches zero. It has the same effect and requirements as an External Warm Reset ( $\overline{\text{RESET}}$  pin), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- $\overline{\text{RSTOUT\_WD\_OUT}}$  is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

In addition, a Watchdog Reset always results in  $\overline{\text{RSTOUT\_WD\_OUT}}$  being asserted, regardless of whether the BTMODE[11] pin was latched as "0" or "1".

### 7.3.6 Software Global Cold Reset

A Software Global Cold Reset is initiated under software control. It has the same effect and requirements as a POR Reset, with the following exceptions:

- BTMODE[15:0] pins are not re-latched and EMAC Switch (optional) is not reset
- $\overline{\text{RSTOUT\_WD\_OUT}}$  is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

Software initiates a Software Global Cold Reset by writing a "1" to the RST\_GLOBAL\_COLD\_SW bit in the PRM\_RSTCTRL register in the PRCM.

For more detailed information on the PRM\_RSTCTRL register, see the PRCM Registers section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.3.7 Software Global Warm Reset

A Software Global Warm Reset is initiated under software control. It has the same effect and requirements as a External Warm Reset ( $\overline{\text{RESET}}$  pin), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- $\overline{\text{RSTOUT\_WD\_OUT}}$  is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

Software initiates a Software Global Warm Reset by writing a "1" to the RST\_GLOBAL\_WARM\_SW bit in the PRM\_RSTCTRL register in the PRCM.

For more detailed information on the PRM\_RSTCTRL register, see the PRCM Registers section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.3.8 Test Reset ( $\overline{\text{TRST}}$ pin)

A Test Reset is activated by the emulator asserting the  $\overline{\text{TRST}}$  pin. The only effect a Test Reset has is to reset the Test and Emulation Logic.

### 7.3.9 Local Reset

The Local Reset for various Modules within the device is controlled by programming the PRCM and/or the Peripheral Module's internal registers. Only the associated Module is reset when a Local Reset is asserted, leaving the rest of the device unaffected.

For more details on Peripheral Local Resets, see the Reset Management section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.3.10 Reset Priority

If any of the above reset sources occur simultaneously, the device only processes the highest-priority reset request. The reset request priorities, from high-to-low, are as follows:

1. Power-on Reset ( $\overline{\text{POR}}$ )
2. Test Reset ( $\overline{\text{TRST}}$ )
3. External Warm Reset ( $\overline{\text{RESET}}$  pin)
4. Emulation Warm Resets
5. Watchdog Reset
6. Software Global Cold/Warm Resets

### 7.3.11 Reset Status Register

The Reset Status Register (PRM\_RSTST) contains information about the last reset that occurred in the system. For more information on this register, see the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.3.12 PCIE Reset Isolation

The device supports reset isolation for the PCI Express (PCIE) module. This means that the PCI Express Subsystem can be reset without resetting the rest of the device.

When the device is a PCI Express Root Complex (RC), the PCIE Subsystem can be reset by software through the PRCM. Software should ensure that there are no ongoing PCIE transactions before asserting this reset by first taking the PCIE Subsystem into the IDLE state. After bringing the PCIE Subsystem out of reset, bus enumeration should be performed again and should treat all Endpoints (EP) as if they had just been connected.

When the device is a PCI Express Endpoint (EP), the PCIE Subsystem will generate an interrupt when an in-band reset is received. Software should process this interrupt by putting the PCIE Subsystem in the IDLE state and then asserting the PCIE local reset through the PRCM.

All device level resets mentioned in the previous sections, except Test Reset, will also reset the PCIE Subsystem. Therefore, the PCIE peripheral should issue a Hot Reset to all downstream devices and re-enumerate the bus upon coming out of reset.

For more detailed information on reset isolation procedures, see the PCIe Reset Isolation section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 7.3.13 EMAC Switch Reset Isolation

The device supports reset isolation for the Ethernet Switch (EMAC Switch). This allows the device to undergo all resets listed in [Section 7.3.1, System-Level Reset Sources](#), with the exception of  $\overline{\text{POR}}$  Reset, without disrupting the Ethernet Switch or the traffic being routed through the switch during the reset condition. The following reset types can optionally provide an EMAC Switch reset isolation by setting the ISO\_CONTROL bit in the RESET\_ISO Control Module register to a "1":

- External Warm Reset
- Emulation Warm Reset
- Watchdog Reset
- Software Global Cold Reset
- Software Global Warm Reset

When one of above resets occurs and the Ethernet Switch (EMAC Switch) is programmed to be isolated:

- The switch function of the EMAC Switch and the PLL embedded in the SATA SERDES Module (which provides the reference clocks to the EMAC Switch) will not be reset.
- Several Control Module registers are not reset. For more details, see the description of the RESET\_ISO register in the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).
- The pin multiplexing of some of the EMAC Switch pins is unaffected. For more details, see the description of the RESET\_ISO register in the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

The EMAC Switch is always reset when:

- One of the above resets occurs and the Ethernet Switch is programmed to be “not isolated”
- A  $\overline{\text{POR}}$  Reset occurs

### 7.3.14 $\overline{\text{RSTOUT\_WD\_OUT}}$ Pin

The  $\overline{\text{RSTOUT\_WD\_OUT}}$  pin reflects device reset status and is de-asserted (high) when the device is out reset. This output will always be asserted when a Watchdog Timer reset (Watchdog Reset) occurs. In addition, this output is always 3-stated and the internal pull resistor is disabled on this pin while  $\overline{\text{POR}}$  and/or  $\overline{\text{RESET}}$  is asserted; therefore, an external pullup/pulldown can be used to set the state of this pin (high/low) while  $\overline{\text{POR}}$  and/or  $\overline{\text{RESET}}$  is asserted. For more detailed information on external PUs/PDs, see [Section 4.5.1, Pullup/Pulldown Resistors](#).

If the BTMODE[11] pin is latched as a "0" at the rising edge of  $\overline{\text{POR}}$  or  $\overline{\text{RESET}}$ , then  $\overline{\text{RSTOUT\_WD\_OUT}}$  is also asserted when any of the below resets occur:

- Power-On Reset (asserted after the BTMODE[11] pin is latched)
- External Warm Reset (asserted after the BTMODE[11] pin is latched)
- Emulation Warm Reset
- Software Global Cold/Warm Reset

The  $\overline{\text{RSTOUT\_WD\_OUT}}$  pin remains asserted until the PRCM releases the host ARM Cortex-A8 processor for reset.

### 7.3.15 Effect of Reset on Emulation & Trace

The device Emulation & Trace Logic will only be reset by the following sources:

- Power-On Reset
- Software Global Cold Reset
- Test Reset

Other than these three reset types, none of the other resets will affect the Emulation and Trace Logic. However, the multiplexing of the EMU[4:2] pins is reset by all system reset types except Test Reset.

### 7.3.16 Reset During Power Domain Switching

Each Power Domain has a dedicated Warm Reset and Cold Reset. Warm Reset for a Power Domain is asserted under either of the following two conditions:

1. An External Warm Reset, Emulation Warm Reset, or Software Global Warm Reset occurs
2. When that Power Domain switches from the "ON" state to the "OFF" state

Cold Reset for a Power Domain is asserted under either of the following two conditions:

1. Power-On Reset or Software Global Cold Reset occurs
2. When that Power Domain switches from the "OFF" state to the "ON" state

### 7.3.17 Pin Behaviors at Reset

When any reset, other than Test Reset, (all described in [Section 7.3.1, System-Level Reset Sources](#)) is asserted, all device I/O pins are reset into a Hi-Z state except for:

- Emulation Pins. These pins are only put into a Hi-Z state when Test Reset ( $\overline{\text{TRST}}$ ) is asserted.
- EMAC Switch Pins. These pins are always put into a Hi-Z state during Power-On Reset. However, some EMAC Switch pins will **not** be put into a Hi-Z state during the other reset modes when the ISO\_CONTROL bit in the RESET\_ISO register of the Control Module is programmed as a "1". For more details, see the description of the RESET\_ISO register in the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).
- $\overline{\text{RSTOUT\_WD\_OUT}}$  Pin during any reset types except for  $\overline{\text{POR}}$  and  $\overline{\text{RESET}}$ . For more detailed information on  $\overline{\text{RSTOUT\_WD\_OUT}}$  pin behavior, see [Section 7.3.14,  \$\overline{\text{RSTOUT\\_WD\\_OUT}}\$  Pin](#).
- DDR[0]/[1] Address/Control Pins (CLK,  $\overline{\text{CLK}}$ , CKE,  $\overline{\text{WE}}$ ,  $\overline{\text{CS}}[1]/[0]$ , RAS, CAS,  $\overline{\text{ODT}}[1]/[0]$ , RST, BA[2:0], A[14:0]). These pins are 3-stated during reset. However, these pins are then driven to the same value as their internal pull resistor reset value when reset is released (For the direction of the internal pull during reset, see the DDR[0]/[1] Terminal Functions tables in the [Section 3.2.4, LPDDR/DDR2/DDR3 Memory Controller](#) of this document).

In addition, the PINCNTL registers, which control pin multiplexing, enabling the IPU/IPDs, and enabling the receiver, are reset to their default state. Again, enabling the EMAC Switch reset isolation prevents some PINCTRL registers from being reset.

For details on EMAC Switch reset isolation, see the descriptions of the RESET\_ISO register and the PINCNTL registers in the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

Internal pull-up/down (IPU/IPD) resistors are enabled during and immediately after reset as described in [Section 3.2, Terminal Functions](#) of this document.

**NOTE**

Upon coming out of reset, the ARM Cortex-A8 starts executing code from the internal Boot ROM. The Boot ROM code modifies the PINCNTLx registers to configure the associated pins for the chosen primary and backup Bootmodes. For more details on the Boot ROM effects on pin multiplexing, see the *TBD* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

**7.3.18 Reset Electrical Data/Timing****Table 7-9. Timing Requirements for Reset (see [Figure 7-4](#) and [Figure 7-5](#))**

NO.			OPP100		UNIT
			MIN	MAX	
1	$t_{w(RESSET)}$	Pulse duration, $\overline{POR}$ low or $\overline{RESET}$ low		12P <sup>(1)</sup>	ns
2	$t_{su(BOOT)}$	Setup time, BTMODE[15:0] pins valid before $\overline{POR}$ high or $\overline{RESET}$ high	$\overline{POR}$	2P <sup>(2)</sup>	ns
			$\overline{RESET}$	2P <sup>(2)</sup>	ns
3	$t_h(BOOT)$	Hold time, BTMODE[15:0] pins valid after $\overline{POR}$ high or $\overline{RESET}$ high		0	ns

(1) The device clock source **must** be stable and at a valid frequency prior to meeting the  $t_{w(RESSET)}$  requirement.

(2) P = 1/(DEV Clock) frequency in ns.

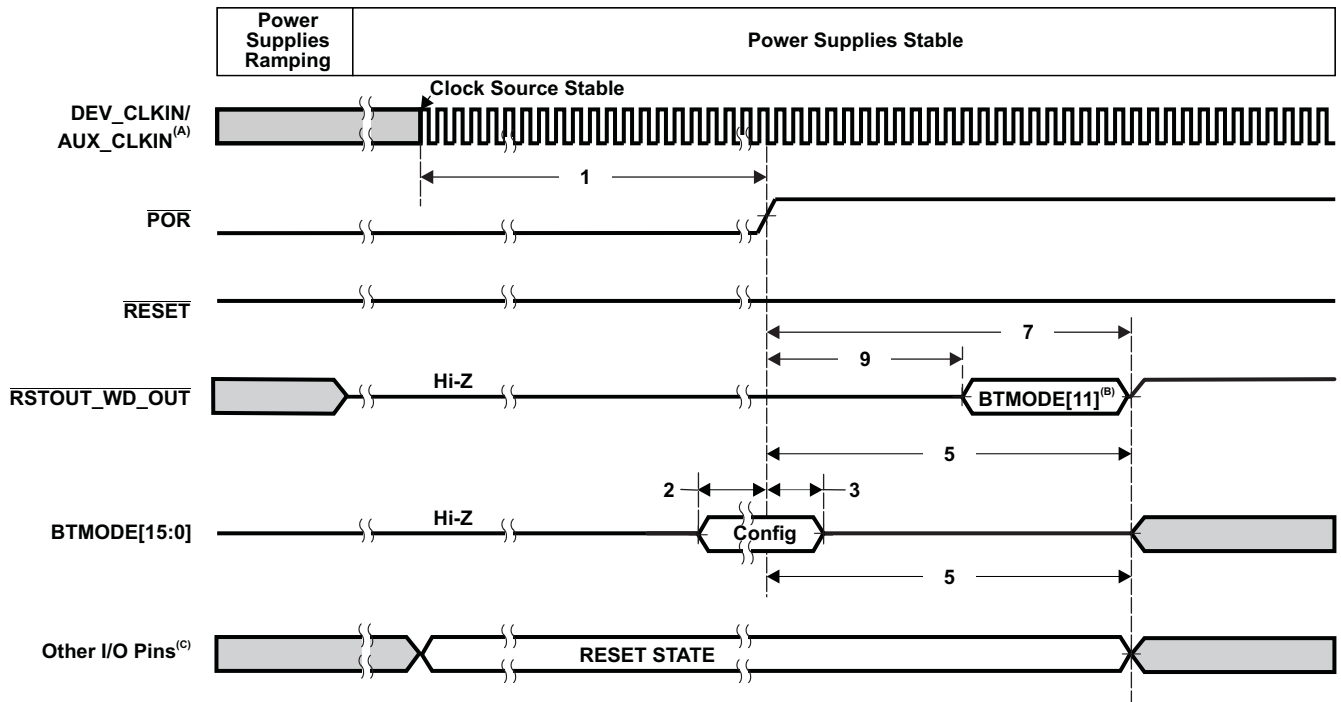

**Table 7-10. Switching Characteristics Over Recommended Operating Conditions During Reset (see [Figure 7-5](#))**

NO.	PARAMETER		OPP100		UNIT	
			MIN	MAX		
4	$t_d(RSTL-IORST)$	Delay time, $\overline{RESET}$ low or $\overline{POR}$ low to all I/Os entering their reset state		14	ns	
5	$t_d(RSTH-IOFUNC)$	Delay time, $\overline{RESET}$ high or $\overline{POR}$ high to all I/Os exiting their reset state		14	ns	
6	$t_d(RSTH-RSTOUTH)$	Delay time, $\overline{RESET}$ high to $\overline{RSTOUT\_WD\_OUT}$ high <sup>(1)(2)</sup>	$\overline{RESET}$ assertion $t_{w(RESSET)} \geq 30P$	0	2P	ns
			$\overline{RESET}$ assertion $t_{w(RESSET)} < 30P$	0	32P - $t_{w(RESSET)}$	ns
7	$t_d(PORH-RSTOUTH)$	Delay time, $\overline{POR}$ high to $\overline{RSTOUT\_WD\_OUT}$ high <sup>(1)(2)</sup>		0	TBD	ns
8	$t_d(RSTL-RSTOUTZ)$	Delay time, $\overline{RESET}$ low to $\overline{RSTOUT\_WD\_OUT}$ Hi-Z <sup>(1)(2)</sup>		0	2P	ns
9	$t_d(PORH-RSTOUTL)$	Delay time, $\overline{POR}$ high to $\overline{RSTOUT\_WD\_OUT}$ driven based on latched BTMODE[11] value <sup>(1)(2)</sup>		0	2P	ns
10	$t_d(RSTH-RSTOUTD)$	Delay time, $\overline{RESET}$ high to $\overline{RSTOUT\_WD\_OUT}$ driven based on latched BTMODE[11] value <sup>(1)(2)</sup>		0	2P	ns

(1) For more detailed information on  $\overline{RSTOUT\_WD\_OUT}$  pin behavior, see [Section 7.3.14,  \$\overline{RSTOUT\\_WD\\_OUT}\$  Pin](#).

(2) P = 1/(DEV Clock) frequency in ns.

Figure 7-4 shows the Power-Up Timing. Figure 7-5 shows the Warm Reset ( $\overline{\text{RESET}}$ ) Timing. Max Reset Timing is identical to Warm Reset Timing, except the BTMODE[15:0] pins are *not* re-latched.

- A. Power supplies and DEV\_CLKIN/AUX\_CLKIN must be stable before the start of  $t_{w(\text{RESET})}$ .
- B.  $\text{RSTOUT\_WD\_OUT}$  only asserted if BTMODE[11] was latched as a "0" when coming out of reset.
- C. For more detailed information on the RESET STATE of each pin, see Section 7.3.17, Pin Behaviors at Reset. Also see Section 3.2, Terminal Functions for the IPU/IPD settings during reset.

Figure 7-4. Power-Up Timing

PRODUCT PREVIEW

- A.  $\overline{\text{RSTOUT\_WD\_OUT}}$  only asserted if BTMODE[11] was latched as a "0" when coming out of reset.
- B. For more detailed information on the RESET STATE of each pin, see [Section 7.3.17, Pin Behaviors at Reset](#). Also see [Section 3.2, Terminal Functions](#) for the IPU/IPD settings during reset.

Figure 7-5. Warm Reset (RESET) Timing

PRODUCT PREVIEW

## 7.4 Clocking

The device clocks are generated from several reference clocks that are fed to on-chip PLLs and dividers (both inside and outside of the PRCM Module). [Figure 7-6](#) shows a high-level overview of the device system clocking structure (Note: to reduce complexity, not all clocking connections are shown). For detailed information on the device clocks, see the Clock Generation and Management section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

Figure 7-6. System Clocking Overview

PRODUCT PREVIEW

### 7.4.1 Device (DEV) and Auxiliary (AUX) Clock Inputs

The device provides two clock inputs, Device (DEVOSC\_MXI/DEV\_CLKIN) and Auxiliary (AUXOSC\_MXI/AUX\_CLKIN). The Device (DEV) clock is used to generate the majority of the internal reference clocks, while the Auxiliary (AUX) clock can optionally be used as a source for the Audio and/or Video PLLs.

The DEV and AUX clocks can be sourced in two ways:

1. Using an external crystal in conjunction with the internal oscillator or
2. Using an external 1.8-V LVCMOS-compatible clock input

**Note:** The external crystals used with the internal oscillators *must* operate in fundamental parallel resonant mode *only*. There is no overtone support.

The DEV Clock should in most cases be 20 MHz. However, it can optionally range anywhere from 20 - 30 MHz if the following are true:

- The DEV Clock is not used to source the SATA reference clock
- A precise 32768-Hz clock is not needed for Real-Time Clock functionality
- If the boot mode is FAST XIP

The AUX Clock is optional and can range from 20-30 MHz. It can be used to source the Audio and/or Video PLLs when a very precise audio or video frequency is required.

#### 7.4.1.1 Using the Internal Oscillators

When the internal oscillators are used to generate the DEV and AUX clocks, external crystals are required to be connected across the DEVOSC or AUXOSC oscillator MXI and MXO pins, along with two load capacitors (see Figure 7-7 and Figure 7-8). The external crystal load capacitors should also be connected to the associated oscillator ground pin (VSSA\_DEVOSC or VSSA\_AUXOSC). The capacitors should *not* be connected to board ground (VSS).

Figure 7-7. Device Oscillator

Figure 7-8. Auxiliary Oscillator

The load capacitors, C1 and C2 in the above pictures, should be chosen such that the below equation is satisfied. CL in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator MXI, MXO, and VSS pins.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 7-11. Input Requirements for Crystal Circuit on the Device Oscillator (DEVOSC)

PARAMETER	MIN	TYP	MAX	UNIT
Start-up time (from power up until oscillating at stable frequency)			4	ms
Crystal Oscillation frequency <sup>(1)</sup>	20	20	30	MHz
Parallel Load Capacitance (C1 and C2)	12		24	pF
Crystal ESR			50	Ω
Crystal Shunt Capacitance			5	pF
Crystal Oscillation Mode	Fundamental Only			n/a
Crystal Frequency stability			±50	ppm

(1) 20-MHz DEV clock is required for all bootmodes other than Fast XIP. For more detailed information on boot modes, see the *ROM Code Memory and Peripheral Booting* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

Table 7-12. Input Requirements for Crystal Circuit on the Auxiliary Oscillator (AUXOSC)

PARAMETER	MIN	MAX	UNIT
Start-up time (from power up until oscillating at stable frequency)		4	ms
Crystal Oscillation frequency	20	30	MHz
Parallel Load Capacitance (C1 and C2)	12	24	pF
Crystal ESR		50	Ω
Crystal Shunt Capacitance		5	pF
Crystal Oscillation Mode	Fundamental Only		n/a
Crystal Frequency stability <sup>(1)</sup>		±50	ppm

(1) Applies only when sourcing the HDMI or HDVPSS DAC clocks from the AUXOSC

PRODUCT PREVIEW

### 7.4.1.2 Using a 1.8V LVCMOS-Compatible Clock Input

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillators as the DEV and AUX clock inputs to the system. The external connections to support this are shown in Figure 7-9 and Figure 7-10. The DEV\_CLKIN and AUX\_CLKIN pins are connected to the 1.8-V LVCMOS-Compatible clock sources. The DEV\_MXO and AUX\_MXO pins are left unconnected. The VSSA\_DEVOSC and VSSA\_AUXOSC pins are connected to board ground (VSS).

Figure 7-9. 1.8-V LVCMOS-Compatible Clock Input (DEV\_OSC)

Figure 7-10. 1.8-V LVCMOS-Compatible Clock Input (AUX\_OSC)

The clock source **must** meet the DEVOSC\_MXI/DEV\_CLKIN timing requirements shown in Table 7-15, *Timing Requirements for DEVOSC\_MXI/DEV\_CLKIN*.

The clock source must meet the AUXOSC\_MXI/AUX\_CLKIN timing requirements shown in Table 7-16, *Timing Requirements for AUXOSC\_MXI/AUX\_CLKIN*.

### 7.4.2 SERDES\_CLKN/P Input Clock

A high-quality, low-jitter differential clock source is required for the PCIE PHY and is an optional clock source for the SATA PHY. The clock is required to be AC coupled to the device's SERDES\_CLKP and SERDES\_CLKN pins according to the specifications in Table 7-13. Both the clock source and the coupling capacitors should be placed physically as close to the processor as possible. In addition, make sure to follow any PCB routing and termination recommendations that the clock source manufacturer recommends.

Table 7-13. SERDES\_CLKN/P AC Coupling Capacitors Recommendations

PARAMETER	MIN	TYP	MAX	UNIT
SERDES_CLKN/P AC coupling capacitor value	0.24	0.27	1.0	nF

**Table 7-13. SERDES\_CLKN/P AC Coupling Capacitors Recommendations (continued)**

PARAMETER		MIN	TYP	MAX	UNIT
	SERDES_CLKN/P AC coupling capacitor package size <sup>(1)(2)</sup>		0402	0603	EIA

(1) L x W, 10 Mil units, i.e., a 0402 is a 40 x 20 Mil surface mount capacitor.

(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side-by-side.

The differential clock source is required to meet the REFCLK AC Specifications outlined in the *PCI EXPRESS CARD ELECTROMECHANICAL SPECIFICATION, REV. 2.0*, at the input to the AC coupling capacitors.

In addition, LVDS clock sources that are compliant to the above specification, but with the following exceptions, are also acceptable:

**Table 7-14. Acceptable Exceptions to the REFCLK AC Specifications for LVDS Clock Sources**

PARAMETER		MIN	MAX	UNIT
V <sub>IH</sub>	Differential High-Level Input Voltage	125	1000	mV
V <sub>IL</sub>	Differential Low-Level Input Voltage	-1000	-125	mV

### 7.4.3 CLKIN32 Input Clock

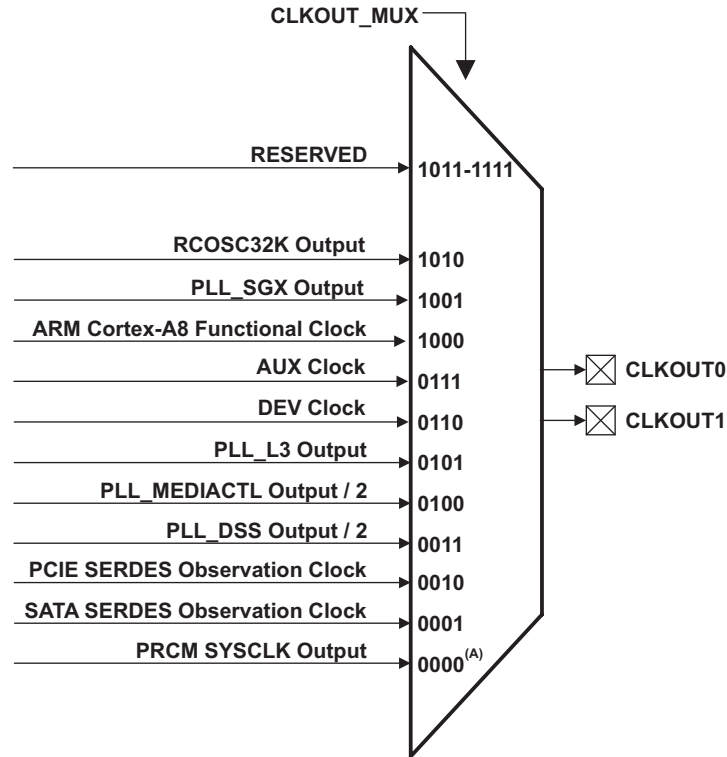

An external 32768-Hz clock input can optionally be provided at the CLKIN32 pin to serve as a reference clock in place of the RTCDIVIDER clock for the following Modules:

- RTC
- GPIO0/1/2/3
- TIMER1/2/3/4/5/6/7
- ARM Cortex-A8
- SYNCTIMER

The CLKIN32 source must meet the timing requirements shown in [Table 7-17](#).

### 7.4.4 Output Clocks Select Logic

The device includes two selectable general-purpose clock outputs (CLKOUT0 and CLKOUT1). The source for these output clocks is controlled by the CLKOUT\_MUX register in the Control Module (see [Figure 7-11](#)).

A. Muxed output of PLL\_VIDEO0, PLL\_AUDIO, and RTCDIVIDER.

Figure 7-11. CLKOUTx Source Selection Logic

For detailed information on the CLKOUTx switching characteristics, see Table 7-18.

### 7.4.5 Input/Output Clocks Electrical Data/Timing

**Note:** If an external clock oscillator is used, a single clean power supply should be used to power both the device and the external clock oscillator circuit.

Table 7-15. Timing Requirements for DEVOSC\_MXI/DEV\_CLKIN<sup>(1)</sup> <sup>(2)</sup> <sup>(3)</sup>(see Figure 7-12)

NO.			OPP100			UNIT
			MIN	NOM	MAX	
1	$t_{c(DMXI)}$	Cycle time, DEVOSC_MXI/DEV_CLKIN	33.33	50	50	ns
2	$t_{w(DMXIH)}$	Pulse duration, DEVOSC_MXI/DEV_CLKIN high	0.45C		0.55C	ns
3	$t_{w(DMXIL)}$	Pulse duration, DEVOSC_MXI/DEV_CLKIN low	0.45C		0.55C	ns
4	$t_{t(DMXI)}$	Transition time, DEVOSC_MXI/DEV_CLKIN			7	ns
5	$t_{j(DMXI)}$	Period jitter, DEVOSC_MXI/DEV_CLKIN			0.02C	ns
		Frequency Stability			±50	ppm

- (1) The DEVOSC\_MXI/DEV\_CLKIN frequency and PLL settings should be chosen such that the resulting SYSCLKs and Module Clocks are within the specific ranges shown in the Section 7.4.7, SYSCLKs and Section 7.4.8, Module Clocks.
- (2) The reference points for the rise and fall transitions are measured at  $V_{IL\ MAX}$  and  $V_{IH\ MIN}$ .
- (3) C = DEV\_CLKIN cycle time in ns. For example, when DEVOSC\_MXI/DEV\_CLKIN frequency is 20 MHz, use C = 50 ns.

4	$t_t(\text{CLKOUTx})$	Transition time, CLKOUTx	0.05P		ns

(1) The reference points for the rise and fall transitions are measured at  $V_{OL\ MAX}$  and  $V_{OH\ MIN}$ .  
 (2)  $P = 1/\text{CLKOUTx clock frequency in nanoseconds (ns)}$ . For example, when CLKOUTx frequency is 200 MHz, use  $P = 5\ \text{ns}$ .

Figure 7-15. CLKOUTx Timing

**7.4.6 PLLs**

The device contains 12 top-level PLLs, and 4 embedded PLLs (within the ARM Cortex-A8, PCIE, SATA, and CSI) that provide clocks to different parts of the system. Figure 7-16 and Figure 7-17 show simplified block diagrams of the Top-Level PLL and PLL\_ARM. In addition, see the System Clocking Overview (Figure 7-6) for a high-level view of the device clock architecture including the PLL reference clock sources and connections.

Figure 7-16. Top-Level PLL Simplified Block Diagram

Figure 7-17. PLL\_ARM Simplified Block Diagram

The reference clock for most of the PLLs comes from the DEV input clock, with select PLLs also having the option to use the AUX input clock as a reference. Also, each PLL supports a Bypass mode in which the reference clock can be directly passed to the PLL CLKOUT through a divider. All device PLL's will come-up in Bypass mode after reset.

For details on programming the device PLLs, see the TBD chapter of the AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual (Literature Number: SPRUGZ7).

### 7.4.6.1 PLL Power Supply Filtering

The device PLLs are supplied externally via the VDDA\_xPLL\_1P8 power-supply pins (where "x" represents ARM, VID0, VID1, AUDIO, DDR, and/or L3). External filtering must be added on the PLL supply pins to ensure that the requirements in [Table 7-19](#) are met.

**Table 7-19. PLL Power Supply Requirements**

PARAMETER	MIN	MAX	UNIT
Dynamic noise at VDDA_xPLL_1P8 pins		50	mV p-p

### 7.4.6.2 PLL Multipliers and Dividers

The Top-Level and PLL\_ARM PLLs support the internal multiplier and divider values shown in [Table 7-20](#), *Top-Level PLL Multiplier and Divider Limits* and [Table 7-21](#), *PLL\_ARM Multiplier and Divider Limits*. The PLLs must be programmed to conform to the various REFCLK, CLKDCO, DCOCLK, and CLKOUT limits described in [Section 7.4.6.3](#), *PLL Frequency Limits*.

**Table 7-20. Top-Level PLL Multiplier and Divider Limits**

PARAMETER	MIN	MAX
N Pre-Divider	0	255
PLL Multiplier (M)	2	4095 <sup>(1)</sup>
M2 Post Divider	1	127
N2 Bypass Divider	0	15

(1) The PLL Multiplier supports fractional values (up to 18-bits of fraction) except when the PLL Multiplier is > 4093.

**Table 7-21. PLL\_ARM Multiplier and Divider Limits**

PARAMETER	MIN	MAX
N Pre-Divider	0	127
PLL Multiplier (M) <sup>(1)</sup>	2	2047 <sup>(2)</sup>
M2 Post Divider	1	31
N2 Bypass Divider	0	15

(1) This parameter describes the limits on the programmable multiplier value M. The multiplication factor for the PLL\_ARM is equal to 2 \* M (also see [Figure 7-17](#)).

(2) The PLL Multiplier supports fractional values (up to 18-bits of fraction) except when the PLL Multiplier is < 20 OR > 2045.

### 7.4.6.3 PLL Frequency Limits

Each PLL supports a minimum and maximum operating frequency for its REFCLK, CLKDCO, and CLKOUT values. The PLLs must be configured not to exceed any of the constraints placed on these values shown in [Table 7-22](#) through [Table 7-24](#). Care must be taken to stay within these limits when selecting external clock input frequencies, internal divider values, and PLL multiply ratios. In addition, limits shown in these tables may be further restricted by the clock frequency limitations of the device modules using these clocks. For more detailed information on the SYSCLK and Module Clock frequency limits, see [Section 7.4.7](#), *SYSCLKs* and [Section 7.4.8](#), *Module Clocks*.

**Table 7-22. Top-Level PLL Frequency Ranges (ALL OPPs)**

CLOCK	MIN	MAX	UNIT
REFCLK	0.5	2.5	MHz
CLKDCO (HS1) <sup>(1)</sup>	1000	2000	MHz
CLKDCO (HS2) <sup>(2)</sup>	500	1000	MHz

(1) The PLL has two modes of operation: HS1 and HS2. The mode of operation should be set, according to the desired CLKDCO frequency, by programming the SELFREQDCO field of the ADPLLJx\_CLKCTRL registers in the Control Module.

(2) CLKDCO of the PLL\_USB is used undivided by the USB modules; therefore, CLKDCO for the PLL\_USB PLL must be programmed to 960 MHz for proper operation.

(1) When the USB is used, PLL\_USB **must** be fixed at 960 MHz.

#### 7.4.6.4 PLL Register Description(s)

The PLL Control Registers reside in the Control Module and are listed in Section TBD, *Control Module* of this datasheet.

#### 7.4.6.5 PLL Electrical Data/Timing

TBD

#### 7.4.7 SYSCLKs

In some cases, the system clock inputs and PLL outputs are sent to the PRCM Module for division and multiplexing before being routed to the various device Modules. These clock outputs from the PRCM Module are called SYSCLKs. Table [Table 7-25](#) lists the device SYSCLKs along with their maximum supported clock frequencies. In addition, limits shown in these tables may be further restricted by the clock frequency limitations of the device modules using these clocks. For more details on Module Clock frequency limits, see [Section 7.4.8 Module Clocks](#).

**Table 7-25. Maximum SYSCLK Clock Frequencies**

#### 7.4.8 Module Clocks

Device Modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM SYSCLK output. Table 7-26 lists the clock source options for each Module on this device, along with the maximum frequency that Module can accept. To ensure proper Module functionality, the device PLLs and dividers **must** be programmed not to exceed the maximum frequencies listed in this table.

**Table 7-26. Maximum Module Clock Frequencies**

## 7.5 Interrupts

The device has a large number of interrupts to service the needs of its many peripherals and subsystems. The ARM Cortex-A8 and Media Controller are capable of servicing these interrupts. The following sections list the device interrupt mapping and multiplexing schemes.

### 7.5.1 ARM Cortex-A8 Interrupts

The ARM Cortex-A8 Interrupt Controller (AINTC) is responsible for prioritizing all service requests from the System peripherals and generating either IRQs or FIQs to the Cortex-A8. The AINTC has the capability to handle up to 128 requests, and the priority of the interrupt inputs are programmable. [Table 7-27](#) lists the interrupt sources for the AINTC.

For more details on ARM Cortex-A8 interrupt control, see the Interrupt Controller section of the *Chip Level Resources* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

**Table 7-27. ARM Cortex-A8 Interrupt Controller (AINTC) Interrupt Sources**

## 8 Peripheral Information and Timings

### 8.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

**Figure 8-1. Test Load Circuit for AC Timing Measurements**

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

#### 8.1.1 1.8-V and 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to  $V_{ref}$  for both "0" and "1" logic levels. For 3.3-V I/O,  $V_{ref} = 1.5$  V. For 1.8-V I/O,  $V_{ref} = 0.9$  V.

**Figure 8-2. Input and Output Voltage Reference Levels for AC Timing Measurements**

All rise and fall transition timing parameters are referenced to  $V_{IL}$  MAX and  $V_{IH}$  MIN for input clocks,  $V_{OL}$  MAX and  $V_{OH}$  MIN for output clocks.

**Figure 8-3. Rise and Fall Transition Time Voltage Reference Levels**

#### 8.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

### 8.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (Literature Number: [SPRA839](#)). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

### 8.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals *must* transition between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner.

### 8.3 Controller Area Network Interface (DCAN)

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM parity check mechanism
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

For more detailed information on the DCAN peripheral, see the *DCAN Controller Area Network* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 8.3.1 DCAN Peripheral Register Description(s)

8.3.2 DCAN Electrical Data/Timing

Table 8-1. Timing Requirements for DCANx Receive<sup>(1)</sup> (see Figure 8-4)

NO.		OPP100			UNIT		
		MIN	NOM	MAX			
	f(baud)	Maximum programmable baud rate			1	Mbps

PRODUCT PREVIEW

## 8.4 EDMA

The EDMA controller handles all data transfers between memories and the device slave peripherals on the device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses.

### 8.4.1 EDMA Channel Synchronization Events

The EDMA channel controller supports up to 64 channels which service peripherals and memory. Each EDMA channel is mapped to a default EDMA synchronization event as shown in [Table 8-3](#). In addition, each EDMA channel can alternatively be mapped to one of the 31 multiplexed EDMA synchronization events shown in [Table 8-4](#). The EVT\_MUX\_x registers in the Control Module are used to select between the default event and the multiplexed events for each channel.

For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, and cleared, etc., see the *Enhanced Direct Memory Access Controller* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

## 8.5 Emulation Features and Capability

### 8.5.1 Advanced Event Triggering (AET)

The device supports Advanced Event Triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware Program Breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data Watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State Sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents:

- *Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs* application report (Literature Number: [SPRA753](#))
- *Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems* application report (Literature Number: [SPRA387](#))

### 8.5.2 Trace

The device supports Trace at the Cortex™-A8 and System levels. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. The debug information can be exported to the Embedded Trace Buffer (ETB), or to the 5-pin Trace Interface (system trace only). Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for Trace Advanced Emulation, see the *Emulation and Trace Headers Technical Reference Manual* (Literature Number: [SPRU655](#)).

### 8.5.3 IEEE 1149.1 JTAG

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The  $\overline{\text{TRST}}$  pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the device's boundary scan functionality. For maximum reliability, the device includes an internal pulldown (IPD) on the  $\overline{\text{TRST}}$  pin to ensure that  $\overline{\text{TRST}}$  is always asserted upon power up and the device's internal emulation logic is always properly initialized. JTAG controllers from Texas Instruments actively drive  $\overline{\text{TRST}}$  high. However, some third-party JTAG controllers may not drive  $\overline{\text{TRST}}$  high but expect the use of a pullup resistor on  $\overline{\text{TRST}}$ . When using this type of JTAG controller, assert  $\overline{\text{TRST}}$  to initialize the device after powerup and externally drive  $\overline{\text{TRST}}$  high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB embedded trace buffer (ETB)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
  - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
  - EMU[4:2] - STM trace only (single direction)

### 8.5.3.1 JTAG ID (JTAGID) Register Description

Table 8-5. JTAG ID Register<sup>(1)</sup>

HEX ADDRESS	ACRONYM	REGISTER NAME
0x4814 0600	JTAGID	JTAG Identification Register <sup>(2)</sup>

- (1) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.
- (2) Read-only. Provides the device 32-bit JTAG ID.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/device ID. For this device, the JTAG ID register resides at address location 0x4814 0600. The register hex value for the device is: 0x0B8F 202F. For the actual register bit names and their associated bit field descriptions, see [Figure 8-5](#) and [Table 8-6](#).

31	28 27	12 11	1 0
VARIANT (4-bit)	PART NUMBER (16-bit)	MANUFACTURER (11-bit)	LSB
R-xxxx	R-1011 1000 1111 0010	R-0000 0010 111	R-1

Figure 8-5. JTAG ID Register Description - Device Register Value: 0x0B8F 202F

Table 8-6. JTAG ID Register Selection Bit Descriptions

Bit	Field	Description
31:28	VARIANT	Variant (4-bit) value. Device value: xxxx. This value reflects the device silicon revision [For example, 0x0 (0000) for initial silicon (1.0)]. For more detailed information on the current device silicon revision(s), see the <i>AM387x Sitara™ ARM Processors Silicon Errata (Silicon Revision 2.1)</i> (Literature Number: <a href="#">SPRZ345</a> ).
27:12	PART NUMBER	Part Number (16-bit) value. Device value: 0xB8F2 (1011 1000 1111 0010)
11:1	MANUFACTURER	Manufacturer (11-bit) value. Device value: 0x017 (0000 0010 111)
0	LSB	LSB. This bit is read as a "1" for this device.

### 8.5.3.2 JTAG Electrical Data/Timing

Table 8-7. Timing Requirements for IEEE 1149.1 JTAG

(see [Figure 8-6](#))

NO.	PARAMETER	DESCRIPTION	OPP100		UNIT
			MIN	MAX	
1	t <sub>c</sub> (TCK)	Cycle time, TCK	51.15		ns
1a	t <sub>w</sub> (TCKH)	Pulse duration, TCK high (40% of t <sub>c</sub> )	20.46		ns
1b	t <sub>w</sub> (TCKL)	Pulse duration, TCK low (40% of t <sub>c</sub> )	20.46		ns
3	t <sub>su</sub> (TDI-TCK)	Input setup time, TDI valid to TCK high (20% of (t <sub>c</sub> * 0.5))	5.115		ns
3	t <sub>su</sub> (TMS-TCK)	Input setup time, TMS valid to TCK high (20% of (t <sub>c</sub> * 0.5))	5.115		ns
4	t <sub>h</sub> (TCK-TDI)	Input hold time, TDI valid from TCK high	10		ns
	t <sub>h</sub> (TCK-TMS)	Input hold time, TMS valid from TCK high	10		ns

PRODUCT PREVIEW

## 8.6 Ethernet MAC Switch (EMAC SW)

The EMAC SW controls the flow of packet data between the device and two external Ethernet PHYs, with hardware flow control and quality-of-service (QOS) support. The EMAC SW contains a 3-port gigabit switch, where one port is internally connected and the other two ports are brought out externally. Each of the external EMAC ports supports 10Base-T (10 Mbits/second [Mbps]), and 100BaseTX (100 Mbps), in either half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode.

The EMAC SW controls the flow of packet data from the device to the external PHYs. The EMAC0/1 ports on the device support four interface modes: Media Independent Interface (MII), Gigabit Media Independent Interface (GMII), Reduced Media Independent Interface (RMII) and Reduced Gigabit Media Independent Interface (RGMII). In addition, a single MDIO interface is pinned out to control the PHY configuration and status monitoring. Multiple external PHYs can be controlled by the MDIO interface.

The EMAC SW module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E). Deviating from this standard, the EMAC SW module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC SW will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network. In addition, the EMAC SW I/Os operate at 3.3 V and are not compatible with 2.5-V I/O signaling. Therefore, only Ethernet PHYs with 3.3-V I/O interface should be used.

In networking systems, packet transmission and reception are critical tasks. The communications port programming interface (CPPI) protocol maximizes the efficiency of interaction between the host software and communications modules. The CPPI block contains 2048 words of 32-bit buffer descriptor memory that holds up to 512 buffer descriptors.

For more detailed information on the EMAC SW module, see the *3PSW Ethernet Subsystem* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 8.6.1 EMAC Peripheral Register Descriptions

**Table 8-12. Ethernet MAC Switch Registers**

ARM/L3 MASTERS EMAC HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x4A10 0000	CPSW_ID_VER	CPSW ID Version Register
0x4A10 0004	CPSW_CONTROL	CPSW Switch Control Register
0x4A10 0008	CPSW_SOFT_RESET	CPSW Soft Reset Register
0x4A10 000C	CPSW_STAT_PORT_EN	CPSW Statistics Port Enable Register
0x4A10 0010	CPSW_PTYPE	CPSW Transmit Priority Type Register
0x4A10 0014	CPSW_SOFT_IDLE	CPSW Software Idle
0x4A10 0018	CPSW_THRU_RATE	CPSW Throughput Rate
0x4A10 001C	CPSW_GAP_THRESH	CPSW CPGMAC_SL Short Gap Threshold
0x4A10 0020	CPSW_TX_START_WDS	CPSW Transmit Start Words
0x4A10 0024	CPSW_FLOW_CONTROL	CPSW Flow Control
0x4A10 0028	P0_MAX_BLKs	CPSW Port 0 Maximum FIFO Blocks Register
0x4A10 002C	P0_BLK_CNT	CPSW Port 0 FIFO Block Usage Count Register (Read Only)
0x4A10 0030	P0_TX_IN_CTL	CPSW Port 0 Transmit FIFO Control
0x4A10 0034	P0_PORT_VLAN	CPSW Port 0 VLAN Register
0x4A10 0038	P0_TX_PRI_MAP	CPSW Port 0 Tx Header Priority to Switch Priority Mapping Register

**Table 8-12. Ethernet MAC Switch Registers (continued)**

ARM/L3 MASTERS EMAC HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
0x4A10 003C	CPDMA_TX_PRI_MAP	CPSW CPDMA TX (Port 0 Rx) Packet Priority to Header Priority Mapping Register
0x4A10 0040	CPDMA_RX_CH_Map	CPSW CPDMA RX (Port 0 Tx) Switch Priority to DMA Channel Mapping Register
0x4A10 0050	P1_MAX_BLKs	CPSW Port 1 Maximum FIFO Blocks Register
0x4A10 0054	P1_BLK_CNT	CPSW Port 1 FIFO Block Usage Count (Read Only)
0x4A10 0058	P1_TX_IN_CTL	CPSW Port 1 Transmit FIFO Control
0x4A10 005C	P1_PORT_VLAN	CPSW Port 1 VLAN Register

PRODUCT PREVIEW

**Table 8-22. Timing Requirements for EMAC RGMII Input Receive for 10/100/1000 Mbps<sup>(1)</sup>**

(see Figure 8-16)

NO.				OPP100		UNIT
				MIN	MAX	
5	$t_{su}(RGRXD-RGRXCH)$	Setup time, receive selected signals valid before EMAC[x]_RGRXC (at DSP) high/low	Internal delay enabled	1.0		ns
			Internal delay disabled	-0.5		ns
6	$t_h(RGRXCH-RGRXD)$	Hold time, receive selected signals valid after EMAC[x]_RGRXC (at DSP) high/low	Internal delay enabled	1.0		ns
			Internal delay disabled	-0.5		ns

(1) For RGMII, receive selected signals include: EMAC[x]\_RGRXD[3:0] and EMAC[x]\_RGRXCTL.

- A. EMAC[x]\_RGRXC must be externally delayed relative to the data and control pins. The internal delay can be enabled or disabled via the EMAC RGMII\_ID\_MODE\_N register.
- B. Data and control information is received using both edges of the clocks. EMAC[x]\_RGRXD[3:0] carries data bits 3-0 on the rising edge of EMAC[x]\_RGRXC and data bits 7-4 on the falling edge of EMAC[x]\_RGRXC. Similarly, EMAC[x]\_RGRXCTL carries RXDV on rising edge of EMAC[x]\_RGRXC and RXERR on falling edge of EMAC[x]\_RGRXC.

PRODUCT PREVIEW

### 8.6.3 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The MDIO module implements the 802.3 serial management interface to interrogate and control Ethernet PHY(s) using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC SW, retrieve the negotiation results, and configure required parameters in the EMAC SW module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. A single MDIO interface is pinned out to control the PHY configuration and status monitoring. Multiple external PHYs can be controlled by the MDIO interface.

For more detailed information on the MDIO peripheral, see the *3PSW Ethernet Subsystem* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 8.6.3.1 MDIO Peripheral Register Descriptions

PRODUCT PREVIEW

## 8.7 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register controls the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts in different interrupt generation modes. The GPIO peripheral provides generic connections to external devices.

The device contains four GPIO modules and each GPIO module is made up of 32 identical channels.

The device GPIO peripheral supports the following:

- Up to 128 1.8-V/3.3-V GPIO pins, GP0[0:31], GP1[0:31], GP2[0:31], and GP3[0:31] (the exact number available varies as a function of the device configuration). Each channel can be configured to be used in the following applications:
  - Data input/output
  - Keyboard interface with a de-bouncing cell
  - Synchronous interrupt generation (in active mode) upon the detection of external events (signal transition(s) and/or signal level(s)).
- Synchronous interrupt requests from each channel are processed by four identical interrupt generation sub-modules to be used independently by the ARM or Media Controller. Interrupts can be triggered by rising and/or falling edge, specified for each interrupt-capable GPIO signal.
- Shared registers can be accessed through "Set & Clear" protocol. Software writes 1 to corresponding bit position(s) to set or to clear GPIO signal(s). This allows multiple software processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate input/output registers.
- Output register in addition to set/clear so that, if preferred by software, some GPIO output signals can be toggled by direct write to the output register(s).
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic to be implemented.

For more detailed information on GPIOs, see the *General-Purpose I/O (GPIO) Interface* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

## 8.8 General-Purpose Memory Controller (GPMC) and Error Location Module (ELM)

The GPMC is a device memory controller used to provide a glueless interface to external memory devices such as NOR Flash, NAND Flash (with BCH and Hamming Error Code Detection for 8-bit or 16-bit NAND Flash), SRAM, and Pseudo-SRAM. It includes flexible asynchronous protocol control for interface to SRAM-like memories and custom logic (FPGA, CPLD, ASICs, etc.).

Other supported features include:

- 8-/16-bit wide multiplexed address/data bus
- 512 MBytes maximum addressing capability divided among up to eight chip selects
- Non-multiplexed address/data mode
- Pre-fetch and write posting engine associated with system DMA to get full performance from NAND device with minimum impact on NOR/SRAM concurrent access.

The device also contains an Error Locator Module (ELM) which is used to extract error addresses from syndrome polynomials generated using a BCH algorithm. Each of these polynomials gives a status of the read operations for a 512 bytes block from a NAND flash and its associated BCH parity bits, plus optionally spare area information. The ELM has the following features:

- 4-bit, 8-bit and 16-bit per 512byte block error location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error location process completion
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

## 8.9 High-Definition Multimedia Interface (HDMI)

The device includes an HDMI 1.3a-compliant transmitter for digital video and audio data to display devices. The HDMI interface consists of a digital HDMI transmitter core with TMDS encoder, a core wrapper with interface logic and control registers, and a transmit PHY, with the following features:

- Hot-plug detection
- Consumer electronics control (CEC) messages
- DVI 1.0 compliant (only RGB pixel format)
- CEA 861-D and VESA DMT formats
- Supports up to 165-MHz pixel clock
  - 1920 x 1080p @75 Hz with 8-bit/component color depth
  - 1600 x 1200 @60 Hz with 8-bit/component color depth
- Support for deep-color mode:
  - 10-bit/component color depth up to 1080p @60 Hz (Max pixel clock = 148.5 MHz)
  - 12-bit/component color depth up to 720p/1080i @60 Hz (Max pixel clock = 123.75 MHz)
- TMDS clock to the HDMI-PHY is up to 185.625 MHz
- Maximum supported pixel clock:
  - 165 MHz for 8-bit color depth
  - 148.5 MHz for 10-bit color depth
  - 123.75 MHz for 12-bit color depth
- Uncompressed multichannel (up to eight channels) audio (L-PCM) support
- Master I2C interface for display data channel (DDC) connection
- Options available to support HDCP encryption engine for transmitting protected audio and video (for information, contact your local TI sales representative).

For more details on the HDMI, see the *High-Definition Multimedia Interface (HDMI)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 8.9.1 HDMI Design Guidelines

This section provides PCB design and layout guidelines for the HDMI interface. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. Simulation and system design work has been done to ensure the HDMI interface requirements are met.

#### 8.9.1.1 HDMI Interface Schematic

The HDMI bus is separated into three main sections:

1. Transition Minimized Differential Signaling (TMDS) high-speed digital video interface
2. Display Data Channel (I2C bus for configuration and status exchange between two devices)
3. Consumer Electronics Control (optional) for remote control of connected devices.

The DDC and CEC are low-speed interfaces, so nothing special is required for PCB layout of these signals. Their connection is shown in [Figure 8-37](#), *HDMI Interface High-Level Schematic*.

The TMDS channels are high-speed differential pairs and, therefore, require the most care in layout. Specifications for TMDS layout are below.

[Figure 8-37](#) shows the HDMI interface schematic. The specific pin numbers can be obtained from [Table 3-15](#), *HDMI Terminal Functions*.

A. 5K-10K  $\Omega$  pullup resistors are required if not integrated in the ESD protection chip.

Figure 8-37. HDMI Interface High-Level Schematic

8.9.1.2 TMDS Routing

The TMDS signals are high-speed differential pairs. Care must be taken in the PCB layout of these signals to ensure good signal integrity.

The TMDS differential signal traces must be routed to achieve 100  $\Omega$  ( $\pm 10\%$ ) differential impedance and 60  $\Omega$  ( $\pm 10\%$ ) single-ended impedance. Single-ended impedance control is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 60  $\Omega$  impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations do not affect impedance as much; therefore, it is easier to maintain an accurate impedance over the length of the signal. The wider traces also show reduced skin effect and, therefore, often result in better signal integrity.

Table 8-38 shows the routing specifications for the TMDS signals.

Table 8-38. TMDS Routing Specifications

PARAMETER	MIN	TYP	MAX	UNIT
MPU-to-HDMI header trace length			7000	Mils
Number of stubs allowed on TMDS traces			0	Stubs
TX/RX pair differential impedance	90	100	110	$\Omega$
TX/RX single ended impedance	54	60	66	$\Omega$

PRODUCT PREVIEW

**Table 8-38. TMDS Routing Specifications (continued)**

PARAMETER	MIN	TYP	MAX	UNIT
Number of vias on each TMDS trace			2	Vias <sup>(1)</sup>
TMDS differential pair to any other trace spacing	2*DS <sup>(2)</sup>			

(1) Vias must be used in pairs with their distance minimized.

(2) DS = differential spacing of the HDMI traces.

### 8.9.1.3 DDC Signals

As shown in [Figure 8-37](#), *HDMI Interface High-Level Schematic*, the DDC connects just like a standard I2C bus. As such, resistor pullups must be used to pull up the open drain buffer signals unless they are integrated into the ESD protection chip used. If used, these pullup resistors should be connected to a 3.3-V supply.

### 8.9.1.4 HDMI ESD Protection Device (Required)

Interfaces that connect to a cable such as HDMI generally require more ESD protection than can be built into the processor's outputs. Therefore, this HDMI interface requires the use of an ESD protection chip to provide adequate ESD protection and to translate I2C voltage levels from the 3.3 V supplied by the device to the 5 volts required by the HDMI specification.

When selecting an ESD protection chip, choose the lowest capacitance ESD protection available to minimize signal degradation. In no case should the ESD protection circuit capacitance be more than 5 pF.

TI manufactures devices that provide ESD protection for HDMI signals such as the TPD12S521. For more information see the [www.ti.com](http://www.ti.com) website.

### 8.9.1.5 PCB Stackup Specifications

[Table 8-39](#) shows the stackup and feature sizes required for HDMI.

**Table 8-39. HDMI PCB Stackup Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCB routing/plane layers	4	6	-	Layers
Signal routing layers	2	3	-	Layers
Number of ground plane cuts allowed within HDMI routing region	-	-	0	Cuts
Number of layers between HDMI routing region and reference ground plane	-	-	0	Layers
PCB trace width	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10	-	Mils
MPU device BGA pad size <sup>(1)(2)</sup>		0.4		mm

(1) Non-solder mask defined pad.

(2) Per IPC-7351A BGA pad size guideline.

### 8.9.1.6 Grounding

Each TMDS channel has its own shield pin which should be grounded to provide a return current path for the TMDS signal.

## 8.10 High-Definition Video Processing Subsystem (HDVPSS)

The device High-Definition Video Processing Subsystem (HDVPSS) provides a video input interface for external imaging peripherals (i.e., image sensors, video decoders, etc.) and a video output interface for display devices, such as analog SDTV displays, digital HDTV displays, digital LCD panels, etc. It includes HD and SD video encoders and an HDMI transmitter interface.

The device HDVPSS features include:

- Two display processing pipelines with de-interlacing, scaling, alpha blending, chroma keying, color space conversion, flicker filtering, and pixel format conversion.
- HD/SD compositor features for PIP support.
- Format conversions (up to 1080p 60 Hz) include scan format conversion, scan rate conversion, aspect-ratio conversion, and frame size conversion.
- Supports additional video processing capabilities by using the subsystem's memory-to-memory feature.
- Two parallel video processing pipelines support HD (up to 1080p60) and SD (NTSC/PAL) simultaneous outputs.
  - SD analog output with OSD with embedded timing codes (BT.656)
    - S-video or Composite output
    - 2-channel SD-DAC with 10-bit resolution
    - Options available to support MacroVision and CGMS-A (contact local TI Sales rep for information).
  - Digital HDMI 1.3a-compliant transmitter (for details, see [Section 8.9, High-Definition Multimedia Interface \(HDMI\)](#)).
  - One digital video output supporting up to 30-bits @ 165 MHz
  - One digital video output supporting up to 24-bits @ 165 MHz
- Two independently configurable external video input capture ports (up to 165 MHz).
  - 16/24-bit HD digital video input or dual clock independent 8-bit SD inputs on each capture port.
  - 8/16/24-bit digital video input
  - 8-bit digital video input
  - Embedded sync and external sync modes are supported for all input configurations (VIN1 Port B supports embedded sync only).
  - De-multiplexing of both pixel-to-pixel and line-to-line multiplexed streams, effectively supporting up to 16 simultaneous SD inputs with a glueless interface to an external multiplexer such as the TVP5158.
  - Additional features include: programmable color space conversion, scaler and chroma downsampler, ancillary VANC/VBI data capture (decoded by software).
- Graphics features:
  - Three independently-generated graphics layers.
  - Each supports full-screen resolution graphics in HD, SD or both.
  - Up/down scaler optimized for graphics.
  - Global and pixel-level alpha blending supported.

For more detailed information on specific features and registers, see the *High Definition Video Processing Subsystem* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

### 8.10.2 Video DAC Guidelines and Electrical Data/Timing

The device's analog video DAC outputs can be operated in one of two modes: Normal mode and TVOUT Bypass mode. In Normal mode, the device's internal video amplifier is used. In TVOUT Bypass mode, the internal video amplifier is bypassed and an external amplifier is required.

Figure 8-41 shows a typical circuit that permits connecting the analog video output from the device to standard 75-Ω impedance video systems in Normal mode. Figure 8-42 shows a typical circuit that permits connecting the analog video output from the device to standard 75-Ω impedance video systems in TVOUT Bypass mode.

- A. Reconstruction Filter (optional)
- B. AC coupling capacitor (optional)

Figure 8-41. TV Output (Normal Mode)

- A. Reconstruction Filter (optional). Note: An amplifier with an integrated reconstruction filter can alternatively be used instead of a discrete reconstruction filter.
- B. AC coupling capacitor (optional)

Figure 8-42. TV Output (TVOUT Bypass Mode)

During board design, the onboard traces and parasitics must be matched for the channel. The video DAC output pins (TV\_OUTx/TV\_VFBx) are very high-frequency analog signals and must be routed with extreme care. As a result, the paths of these signals must be as short as possible, and as isolated as possible from other interfering signals. In TVOUT Bypass mode, the load resistor and amplifier/buffer should be placed as close as possible to the TV\_VFBx pins. Other layout guidelines include:

- Take special care to bypass the VDDA\_VDAC\_1P8 power supply pin with a capacitor. For more information, see Section 7.2.9, Power-Supply Decoupling.
- In **TVOUT Bypass mode**, place the R\_LOAD resistor as close as possible to the Reconstruction Filter and Amplifier. In addition, place the 75-Ω resistor as close as possible (< 0.5 ") to the Amplifier/buffer output pin. To maintain a high-quality video signal, the onboard traces after the 75-Ω resistor should have a characteristic impedance of 75 Ω (± 20%).
- In **Normal mode**, TV\_VFBx is the most sensitive pin in the TV out system. The R\_OUT resistor should be placed as close as possible to the device pins. To maintain a high-quality video signal, the onboard traces leading to the TV\_OUTx pin should have a characteristic impedance of 75 Ω (± 20%) starting from the closest possible place to the device pin output.
- Minimize input trace lengths to the device to reduce parasitic capacitance.
- Include solid ground return paths.
- Match trace lengths as close as possible within a video format group (i.e., Y and C for S-Video output should match each other).

For additional Video DAC Design guidelines, see the *High Definition Video Processing Subsystem* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

**Table 8-42. Static and Dynamic DAC Specifications**

VDAC STATIC SPECIFICATIONS					
PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Reference Current Setting Resistor (R <sub>SET</sub> )	Normal Mode	4653	4700	4747	Ω

	TVOUT Bypass Mode, 100 mVpp @ 6 MHz on VDDA_VDAC_1P8		20		

## 8.11 Inter-Integrated Circuit (I2C)

The device includes four inter-integrated circuit (I2C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports the following features:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Standard and fast modes from 10 - 400 Kbps (no fail-safe I/O buffers)
- Noise filter to remove noise 50 ns or less
- Seven- and ten-bit device addressing modes
- Multimaster transmitter/slave receiver mode
- Multimaster receiver/slave transmitter mode
- Combined master transmit/receive and receive/transmit modes
- Two DMA channels, one interrupt line
- Built-in FIFO (32 byte) for buffered read or write.

For more detailed information on the I2C peripheral, see the *Inter-Integrated Circuit (I2C) Controller Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

8.11.2 I2C Electrical Data/Timing

Table 8-44. Timing Requirements for I2C Input Timings<sup>(1)</sup>

(see Figure 8-43)

NO.			OPP100				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_{c(SCL)}$	Cycle time, SCL	10		2.5		$\mu$ s
2	$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		$\mu$ s
3	$t_{h(SDAL-SCLL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		$\mu$ s
4	$t_w(SCLL)$	Pulse duration, SCL low	4.7		1.3		$\mu$ s
5	$t_w(SCLH)$	Pulse duration, SCL high	4		0.6		$\mu$ s
6	$t_{su(SDAV-SCLH)}$	Setup time, SDA valid before SCL high	250		100 <sup>(2)</sup>		ns
7	$t_{h(SCLL-SDAV)}$	Hold time, SDA valid after SCL low	0 <sup>(3)</sup>	3.45 <sup>(4)</sup>	0 <sup>(3)</sup>	0.9 <sup>(4)</sup>	$\mu$ s
8	$t_w(SDAH)$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		$\mu$ s
9	$t_r(SDA)$	Rise time, SDA		1000	$20 + 0.1C_b$ <sup>(5)</sup>	300	ns
10	$t_r(SCL)$	Rise time, SCL		1000	$20 + 0.1C_b$ <sup>(5)</sup>	300	ns
11	$t_f(SDA)$	Fall time, SDA		300	$20 + 0.1C_b$ <sup>(5)</sup>	300	ns
12	$t_f(SCL)$	Fall time, SCL		300	$20 + 0.1C_b$ <sup>(5)</sup>	300	ns
13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		$\mu$ s
14	$t_w(SP)$	Pulse duration, spike (must be suppressed)			0	50	ns
15	$C_b$ <sup>(5)</sup>	Capacitive load for each bus line		400		400	pF

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I<sup>2</sup>C-bus™ device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement  $t_{su(SDA-SCLH)} \geq 250$  ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line  $t_r \max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250$  ns (according to the Standard-mode I<sup>2</sup>C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the  $V_{IHmin}$  of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum  $t_{h(SDA-SCLL)}$  has only to be met if the device does not stretch the low period [ $t_w(SCLL)$ ] of the SCL signal.
- (5)  $C_b$  = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

PRODUCT PREVIEW

## 8.12 Imaging Subsystem (ISS)

The device Imaging Subsystem captures and processes pixel data from external image and video inputs. The inputs can be connected to the Image Processing block through the Parallel Camera Interface (CAM). In addition, a Timing control module provides flash strobe and mechanical shutter interfaces. The features of each component of the ISS are described below.

- Parallel Camera (CAM) interface features:
  - Input format
    - Bayer pattern Raw (up to 16bit) or YCbCr 422 (8bit or 16bit) data.
    - ITU-R BT.656/1120 standard format
  - Generates HD/VD timing signals and field ID to an external timing generator, or can synchronize to the external timing generator.
  - Support for progressive and interlaced sensors (hardware support for up to 2 fields and firmware supports for higher number of fields, typically 3-, 4-, and 5-field sensors).
- Image Sensor Interface (ISIF) features:
  - Support for up to 32K pixels (image size) in both the horizontal and vertical direction
  - Color space conversion for non-Bayer pattern Raw data
  - Digital black clamping with Horizontal/Vertical offset drift compensation
  - Vertical Line defect correction based on a lookup table
  - Color-dependent gain control and black level offset control
  - Ability to control output to the LPDDR/DDR2/DDR3 via an external write enable signal
  - Down sampling via programmable culling patterns
  - A-law/DPCM compression
  - Generating 16, 12 or 8bit output to memory
- Two independent Resizers
  - Providing two different sizes of outputs simultaneously on one input
  - Maximum line width is 5376 and 2336, respectively
  - YUV422 to YUV420 conversion
  - Data output format: RGB565, ARGB888, YUV422 co sited and YUV4:2:0 planar
  - Resizer Ratio: x1/4096 ~ x20
  - Input from memory
- Timing control module features:
  - STROBE signal for flash pre-strobe and flash strobe
  - SHUTTER signal for mechanical shutter control
  - Global reset control

For more detailed information on the ISS, see the ISS Overview section, the ISS Interfaces section, and the ISS ISP section of the *Watchdog Timer* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

PRODUCT PREVIEW

### 8.13 LPDDR/DDR2/DDR3 Memory Controller

The device has a dedicated interface to DDR3, DDR2, and LPDDR SDRAM. It supports JEDEC standard compliant LPDDR, DDR2 and DDR3 SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 64Mb, 128Mb, 256Mb, 512Mb, 1Gb, and 2Gb devices
- Support for two independent chip selects, with their corresponding register sets, and independent page tracking
- Two interfaces with associated LPDDR/DDR2/DDR3 PHYs
- Dynamic memory manager allows for interleaving of data between the two DDR interfaces.

For details on the LPDDR/DDR2/DDR3 Memory Controller, see the *DDR2/DDR3 Memory Controller* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

#### 8.13.1 LPDDR/DDR2/DDR3 Memory Controller Electrical Data/Timing

**Table 8-48. Switching Characteristics Over Recommended Operating Conditions for LPDDR/DDR2/DDR3 Memory Controller <sup>(1)</sup>**

NO.	PARAMETER	MODE	OPP100		UNIT
			MIN	MAX	
1	$t_{c(DDR\_CLK)}$ Cycle time, DDR[x]_CLK	LPDDR mode	5		ns
		DDR2/DDR3 mode	2.5		

(1) The PLL\_DDR Controller *must* be programmed such that the resulting DDR[x]\_CLK clock frequency is within the specified range.

**Figure 8-46. LPDDR/DDR2/DDR3 Memory Controller Clock Timing**

#### 8.13.1.1 DDR2 Routing Guidelines

##### 8.13.1.1.1 Board Designs

TI only supports board designs that follow the guidelines outlined in this document. The switching characteristics and the timing diagram for the DDR2 memory controller are shown in [Table 8-49](#) and [Figure 8-47](#).

**Table 8-49. Switching Characteristics Over Recommended Operating Conditions for DDR2 Memory Controller**

NO.	PARAMETER	-1G		UNIT
		MIN	MAX	
1	$t_{c(DDR\_CLK)}$ Cycle time, DDR_CLK	2.5	8	ns

**Figure 8-47. DDR2 Memory Controller Clock Timing**

##### 8.13.1.1.2 DDR2 Interface

This section provides the timing specification for the DDR2 interface as a PCB design and manufacturing

PRODUCT PREVIEW

specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable DDR2 memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this DDR2 specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* Application Report (Literature Number: [SPRAAV0](#)).

#### **8.13.1.1.2.1 DDR2 Interface Schematic**

[Figure 8-48](#) shows the DDR2 interface schematic for a x32 DDR2 memory system. In [Figure 8-49](#) the x16 DDR2 system schematic is identical except that the high-word DDR2 device is deleted.

**T0** Termination is required. See terminator comments.

- A. Vio1.8 is the power supply for the DDR2 memories and the AM387x DDR2 interface.
- B. One of these capacitors can be eliminated if the divider and its capacitors are placed near a VREF pin.

**Figure 8-48. 32-Bit DDR2 High-Level Schematic**

PRODUCT PREVIEW

### 8.13.1.1.2.2 Compatible JEDEC DDR2 Devices

Table 8-50 shows the parameters of the JEDEC DDR2 devices that are compatible with this interface. Generally, the DDR2 interface is compatible with x16 DDR2-800 speed grade DDR2 devices.

**Table 8-50. Compatible JEDEC DDR2 Devices (Per Interface)**

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC DDR2 device speed grade <sup>(1)</sup>	DDR2-800		
2	JEDEC DDR2 device bit width	x16	x16	Bits
3	JEDEC DDR2 device count <sup>(2)</sup>	1	2	Devices
4	JEDEC DDR2 device ball count <sup>(3)</sup>	84	92	Balls

(1) Higher DDR2 speed grades are supported due to inherent JEDEC DDR2 backwards compatibility.

(2) One DDR2 device is used for a 16-bit DDR2 memory system. Two DDR2 devices are used for a 32-bit DDR2 memory system.

(3) The 92-ball devices are retained for legacy support. New designs will migrate to 84-ball DDR2 devices. Electrically, the 92- and 84-ball DDR2 devices are the same.

### 8.13.1.1.2.3 PCB Stackup

The minimum stackup required for routing the AM387x device is a six-layer stackup as shown in Table 8-51. Additional layers may be added to the PCB stackup to accommodate other circuitry or to reduce the size of the PCB footprint.

**Table 8-51. Minimum PCB Stackup**

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly horizontal
2	Plane	Ground
3	Plane	Power
4	Signal	Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly vertical

Complete stackup specifications are provided in [Table 8-52](#).

**Table 8-52. PCB Stackup Specifications**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing/plane layers	6			
2	Signal routing layers	3			
3	Full ground layers under DDR2 routing region	2			
4	Number of ground plane cuts allowed within DDR routing region			0	
5	Number of ground reference planes required for each DDR2 routing layer	1			
6	Number of layers between DDR2 routing layer and reference ground plane			0	
7	PCB routing feature size		4		Mils
8	PCB trace width, w		4		Mils
9	PCB BGA escape via pad size <sup>(1)</sup>		18	20	Mils
10	PCB BGA escape via hole size <sup>(1)</sup>		10		Mils
11	MPU BGA pad size		0.4		mm
13	Single-ended impedance, Z <sub>0</sub>	50		75	Ω
14	Impedance control <sup>(2)</sup>	Z-5	Z	Z+5	Ω

(1) A 20/10 via may be used if enough power routing resources are available. An 18/10 via allows for more flexible power routing to the MPU.

(2) Z is the nominal single-ended impedance selected for the PCB specified by item 13.

8.13.1.1.2.4 Placement

Figure 8-50 shows the required placement for the MPU as well as the DDR2 devices. The dimensions for this figure are defined in Table 8-53. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR2 device is omitted from the placement.

Figure 8-50. AM387x Device and DDR2 Device Placement

Table 8-53. Placement Specifications

NO.	PARAMETER	MIN	MAX	UNIT
1	$X + Y^{(1)(2)}$		1660	Mils
2	$X'^{(1)(2)}$		1280	Mils
3	$X' \text{ Offset}^{(1)(2) (3)}$		650	Mils
4	DDR2 keepout region <sup>(4)</sup>			
5	Clearance from non-DDR2 signal to DDR2 keepout region <sup>(5)</sup>	4		w

- (1) For dimension definitions, see Figure 8-48.
- (2) Measurements from center of MPU to center of DDR2 device.
- (3) For 16-bit memory systems, it is recommended that  $X'$  offset be as small as possible.
- (4) DDR2 keepout region to encompass entire DDR2 routing area.
- (5) Non-DDR2 signals allowed within DDR2 keepout region provided they are separated from DDR2 routing layers by a ground plane.

PRODUCT PREVIEW

8.13.1.1.2.5 DDR2 Keepout Region

The region of the PCB used for the DDR2 circuitry must be isolated from other signals. The DDR2 keepout region is defined for this purpose and is shown in Figure 8-51. The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in Table 8-53.

Figure 8-51. DDR2 Keepout Region

NOTE

The region shown in should encompass all the DDR2 circuitry and varies depending on placement. Non-DDR2 signals should not be routed on the DDR signal layers within the DDR2 keepout region. Non-DDR2 signals may be routed in the region, provided they are routed on layers separated from DDR2 signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.8-V power plane should cover the entire keepout region. Routes for the two DDR interfaces must be separated by at least 4x; the more separation, the better.

8.13.1.1.2.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR2 and other circuitry. Table 8-54 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR2 interfaces and DDR2 device. Additional bulk bypass capacitance may be needed for other circuitry.

Table 8-54. Bulk Bypass Capacitors

No.	Parameter	Min	Max	Unit
1	DVDD18 bulk bypass capacitor count <sup>(1)</sup>	6		Devices
2	DVDD18 bulk bypass total capacitance	60		μF
3	DDR#1 bulk bypass capacitor count <sup>(1)</sup>	1		Devices
4	DDR#1 bulk bypass total capacitance <sup>(1)</sup>	10		μF
5	DDR#2 bulk bypass capacitor count <sup>(2)</sup>	1		Devices
6	DDR#2 bulk bypass total capacitance <sup>(1)(2)</sup>	10		μF

- (1) These devices should be placed near the device they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors. Use half of these capacitors for DDR[0] and half for DDR[1].
- (2) Only used on 32-bit wide DDR2 memory systems.

### 8.13.1.1.2.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR2 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, MPU/DDR power, and MPU/DDR ground connections. [Table 8-55](#) contains the specification for the HS bypass capacitors as well as for the power connections on the PCB.

**Table 8-55. High-Speed Bypass Capacitors**

NO.	PARAMETER	MIN	MAX	UNIT
1	HS bypass capacitor package size <sup>(1)</sup>		0402	10 Mils
2	Distance from HS bypass capacitor to device being bypassed		250	Mils
3	Number of connection vias for each HS bypass capacitor <sup>(2)</sup>	2		Vias
4	Trace length from bypass capacitor contact to connection via	1	30	Mils
5	Number of connection vias for each MPU power/ground ball	1		Vias
6	Trace length from MPU power/ground ball to connection via		35	Mils
7	Number of connection vias for each DDR2 device power/ground ball	1		Vias
8	Trace length from DDR2 device power/ground ball to connection via		35	Mils
9	DVDD18 HS bypass capacitor count <sup>(3)(4)</sup>	40		Devices
10	DVDD18 HS bypass capacitor total capacitance <sup>(5)</sup>	2.4		μF
11	DDR device HS bypass capacitor count <sup>(6)(7)</sup>	8		Devices
12	DDR device HS bypass capacitor total capacitance <sup>(7)</sup>	0.4		μF

- (1) LxW, 10-mil units, i.e., a 0402 is a 40x20-mil surface-mount capacitor.
- (2) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.
- (3) These devices should be placed as close as possible to the device being bypassed.
- (4) Use half of these capacitors for DDR[0] and half for DDR[1].
- (5) Use half of these capacitors for DDR[0] and half for DDR[1].
- (6) These devices should be placed as close as possible to the device being bypassed.
- (7) Per DDR device.

### 8.13.1.1.2.8 Net Classes

[Table 8-56](#) lists the clock net classes for the DDR2 interface. [Table 8-57](#) lists the signal net classes, and associated clock net classes, for the signals in the DDR2 interface. These net classes are used for the termination and routing rules that follow.

**Table 8-56. Clock Net Class Definitions**

CLOCK NET CLASS	MPU PIN NAMES
CK	DDR[x]_CLK/DDR[x]_CLK
DQS0	DDR[x]_DQS[0]/DDR[x]_DQS[0]
DQS1	DDR[x]_DQS[1]/DDR[x]_DQS[1]
DQS2 <sup>(1)</sup>	DDR[x]_DQS[2]/DDR[x]_DQS[2]
DQS3 <sup>(1)</sup>	DDR[x]_DQS[3]/DDR[x]_DQS[3]

- (1) Only used on 32-bit wide DDR2 memory systems.

**Table 8-57. Signal Net Class Definitions**

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	MPU PIN NAMES
ADDR_CTRL	CK	DDR[x]_BA[2:0], DDR[x]_A[14:0], DDR[x]_CS[x], DDR[x]_CAS, DDR[x]_RAS, DDR[x]_WE, DDR[x]_CKE
DQ0	DQS0	DDR[x]_D[7:0], DDR[x]_DQM[0]
DQ1	DQS1	DDR[x]_D[15:8], DDR[x]_DQM[1]
DQ2 <sup>(1)</sup>	DQS2	DDR[x]_D[23:16], DDR[x]_DQM[2]
DQ3 <sup>(1)</sup>	DQS3	DDR[x]_D[31:24], DDR[x]_DQM[3]

(1) Only used on 32-bit wide DDR2 memory systems.

**8.13.1.1.2.9 DDR2 Signal Termination**

Signal terminators are required in CK and ADDR\_CTRL net classes. Serial terminators may be used on data lines to reduce EMI risk; however, serial terminations are the only type permitted. ODT's are integrated on the data byte net classes. They should be enabled to ensure signal integrity. Table 8-58 shows the specifications for the series terminators.

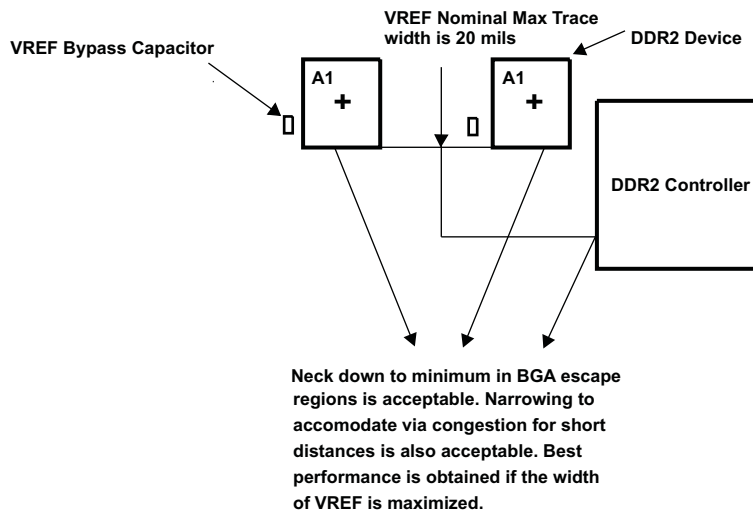

**Table 8-58. DDR2 Signal Terminations**

No.	Parameter	Min	Typ	Max	Unit
1	CK net class <sup>(1)(2)</sup>	0		10	$\Omega$
2	ADDR_CTRL net class <sup>(1)(3)(4)</sup> (2)	0	22	Zo	$\Omega$
3	Data byte net classes (DQS0-DQS3, DQ0-DQ3) <sup>(5)</sup>	0		0	$\Omega$

- (1) Only series termination is permitted, parallel or SST specifically disallowed on board.
- (2) Only required for EMI reduction.
- (3) Terminator values larger than typical only recommended to address EMI issues.
- (4) Termination value should be uniform across net class.
- (5) No external terminations allowed for data byte net classes. ODT is to be used.

**8.13.1.1.2.10 VREFSSTL\_DDR Routing**

VREFSSTL\_DDR is used as a reference by the input buffers of the DDR2 memories as well as the MPU. VREF is intended to be half the DDR2 power supply voltage and should be created using a resistive divider as shown in Figure 8-49. Other methods of creating VREF are not recommended. Figure 8-52 shows the layout guidelines for VREF.

**Figure 8-52. VREF Routing and Topology**

PRODUCT PREVIEW

8.13.1.1.3 DDR2 CK and ADDR\_CTRL Routing

Figure 8-53 shows the topology of the routing for the CK and ADDR\_CTRL net classes. The route is a balanced T as it is intended that the length of segments B and C be equal. In addition, the length of A (A'+A'') should be maximized.

Figure 8-53. CK and ADDR\_CTRL Routing and Topology

Table 8-59. CK and ADDR\_CTRL Routing Specification <sup>(1)</sup>

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center CK-CK spacing			2w	
2	CK/CK skew <sup>(1)</sup>			25	Mils
3	CK B-to-C skew length mismatch			25	Mils
4	Center-to-center CK to other DDR2 trace spacing <sup>(2)</sup>	4w			
5	CK/ADDR_CTRL nominal trace length <sup>(3)</sup>	CACLM-50	CACLM	CACLM+50	Mils
6	ADDR_CTRL-to-CK skew length mismatch			100	Mils
7	ADDR_CTRL-to-ADDR_CTRL skew length mismatch			100	Mils
8	Center-to-center ADDR_CTRL to other DDR2 trace spacing <sup>(2)</sup>	4w			
9	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing <sup>(2)</sup>	3w			
10	ADDR_CTRL B-to-C skew length mismatch			100	Mils

- (1) The length of segment A=A'+A'' as shown in Figure 8-53.
- (2) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (3) CACLM is the longest Manhattan distance of the CK and ADDR\_CTRL net classes.

Figure 8-54 shows the topology and routing for the DQS and DQ net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

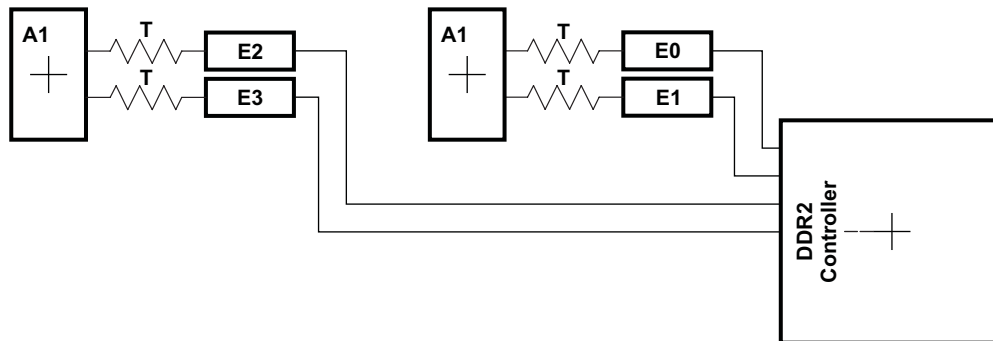

Figure 8-54. DQS and DQ Routing and Topology

PRODUCT PREVIEW

**Table 8-60. DQS and DQ Routing Specification**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center DQS-DQSn spacing in E0 E1 E2 E3			2w	
2	DQS-DQSn skew in E0 E1 E2 E3			25	Mils
3	Center-to-center DQS to other DDR2 trace spacing <sup>(1)</sup>	4w			
4	DQS/DQ nominal trace length <sup>(2)(3)(4)</sup>	DQLM-50	DQLM	DQLM+50	Mils
5	DQ-to-DQS skew length mismatch <sup>(2)(3)(4)</sup>			100	Mils
6	DQ-to-DQ skew length mismatch <sup>(2)(3)(4)</sup>			100	Mils
7	DQ-to-DQ/DQS via count mismatch <sup>(2)(3)(4)</sup>			1	Vias
8	Center-to-center DQ to other DDR2 trace spacing <sup>(1)(5)</sup>	4w			
9	Center-to-center DQ to other DQ trace spacing <sup>(1)(6)(7)</sup>	3w			
10	DQ/DQS E skew length mismatch <sup>(2)(3)(4)</sup>			100	Mils

- (1) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
- (2) A 16-bit DDR memory system has two sets of data net classes; one for data byte 0, and one for data byte 1, each with an associated DQS (2 DQSs) per DDR EMIF used.
- (3) A 32-bit DDR memory system has four sets of data net classes; one each for data bytes 0 through 3, and each associated with a DQS (4 DQSs) per DDR EMIF used.
- (4) There is no need, and it is not recommended, to skew match across data bytes; i.e., from DQS0 and data byte 0 to DQS1 and data byte 1.
- (5) DQs from other DQS domains are considered *other DDR2 trace*.
- (6) DQs from other data bytes are considered *other DDR2 trace*.
- (7) DQLM is the longest Manhattan distance of each of the DQS and DQ net classes.

**8.13.1.2 DDR3 Routing Guidelines**

**8.13.1.2.1 Board Designs**

TI only supports board designs utilizing DDR3 memory that follow the guidelines in this document. The switching characteristics and timing diagram for the DDR3 memory controller are shown in [Table 8-61](#) and [Figure 8-55](#).

**Table 8-61. Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller**

NO.	PARAMETER	-1G		UNIT
		MIN	MAX	
1	t <sub>c(DDR_CLK)</sub> Cycle time, DDR_CLK	2.5	3.3 <sup>(1)</sup>	ns

- (1) This is the absolute maximum the clock period can be. Actual maximum clock period may be limited by DDR3 speed grade and operating frequency (see the DDR3 memory device data sheet).

**Figure 8-55. DDR3 Memory Controller Clock Timing**

**8.13.1.2.1.1 DDR3 versus DDR2**

This specification only covers AM387x MPU PCB designs that utilize DDR3 memory. Designs using DDR2 memory should use the PCB design specifications for DDR2 memory in [Section 8.13.1.1](#). While similar, the two memory systems have different requirements. It is currently not possible to design one PCB that covers both DDR2 and DDR3.

**8.13.1.2.2 DDR3 Device Combinations**

Since there are several possible combinations of device counts and single- or dual-side mounting, [Table 8-62](#) summarizes the supported device configurations.

PRODUCT PREVIEW

**Table 8-62. Supported DDR3 Device Combinations<sup>(1)</sup>**

NUMBER OF DDR3 DEVICES	DDR3 DEVICE WIDTH (BITS)	MIRRORED?	DDR3 EMIF WIDTH (BITS)
1	16	N	16
2	8	Y <sup>(2)</sup>	16
2	16	N	32
2	16	Y <sup>(2)</sup>	32
4	8	N	32
4	8	Y <sup>(3)</sup>	32

(1) This table is per EMIF.

(2) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.

(3) This is two mirrored pairs of DDR3 devices.

#### 8.13.1.2.2.1 DDR3 EMIFs

The MPU contains two separate DDR3 EMIFs. This specification covers one of these EMIFs (DDR[0]) and, thus, needs to be implemented twice, once for each EMIF. The PCB layout generally turns out to be a semi-mirror with DDR[1] being a flipped version of DDR[0]; the only exception being the DDR3 devices themselves are not flipped unless mounted on opposite sides of the PCB. Requirements are identical between the two EMIFs.

#### 8.13.1.2.3 DDR3 Interface Schematic

##### 8.13.1.2.3.1 32-Bit DDR3 Interface

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. [Figure 8-56](#) and [Figure 8-57](#) show the schematic connections for 32-bit interfaces using x16 devices.

##### 8.13.1.2.3.2 16-Bit DDR3 Interface

Note that the 16-bit wide interface schematic is practically identical to the 32-bit interface (see [Figure 8-56](#) and [Figure 8-57](#)); only the high-word DDR memories are removed and the unused DQS inputs are tied off. The MPU DDR[x]\_DQS[2] and DDR[x]\_DQS[3] pins should be pulled to the DDR supply via 1-kΩ resistors. Similarly, the  $\overline{\text{DDR}}[x]_{\text{DQS}}[2]$  and  $\overline{\text{DDR}}[x]_{\text{DQS}}[3]$  pins should be pulled to ground via 1-kΩ resistors.

When not using a DDR interface, the proper method of handling the unused pins is to tie off the DQS pins by pulling the non-inverting DQS pin to the DDR\_1V5 supply via a 1k-Ω resistor and pulling the inverting DQSn pin to ground via a 1k-Ω resistor. This needs to be done for each byte not used. Also, include the 50-Ω pulldown for DDR[x]\_VTP. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32 bits wide, 16 bits wide, or not used.

Figure 8-56. 32-Bit, One-Bank DDR3 Interface Schematic Using Two 16-Bit DDR3 Devices

PRODUCT PREVIEW

PRODUCT PREVIEW

$Z_o$  — Termination is required. See terminator comments.  
 $Z_q$  — Value determined according to the DDR memory device data sheet.

Figure 8-57. 32-Bit, One-Bank DDR3 Interface Schematic Using Four 8-Bit DDR3 Devices

### 8.13.1.2.4 Compatible JEDEC DDR3 Devices

Table 8-63 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1600 devices in the x8 or x16 widths.

**Table 8-63. Compatible JEDEC DDR3 Devices (Per Interface)**

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC DDR3 device speed grade <sup>(1)</sup>	DDR3-800	DDR3-1600 <sup>(2)</sup>	
2	JEDEC DDR3 device bit width	x8	x16	Bits
3	JEDEC DDR3 device count <sup>(3)</sup>	2	4	Devices

(1) DDR3 speed grade depends on desired clock rate. Data rate is 2x the clock rate. For DDR3-800, the clock rate is 400 MHz.

(2) DDR3 devices with speed grades up to DDR3-1600 are supported; however, max clock rate will still be limited to 400 MHz as stated in Table 8-61 *Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller*.

(3) For valid DDR3 device configurations and device counts, see Section 8.13.1.2.3, Figure 8-56, and Figure 8-57.

### 8.13.1.2.5 PCB Stackup

The minimum stackup for routing the DDR3 interface is a four-layer stack up as shown in Table 8-64. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. A six-layer stackup is shown in Table 8-65. Complete stackup specifications are provided in Table 8-66.

**Table 8-64. Minimum PCB Stackup**

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Split power plane
3	Plane	Full ground plane
4	Signal	Bottom routing mostly horizontal

**Table 8-65. Six-Layer PCB Stackup Suggestion**

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Ground
3	Plane	Split power plane
4	Plane	Split power plane or Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly horizontal

Table 8-66. PCB Stackup Specifications

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing/plane layers	4	6		
2	Signal routing layers	2			
3	Full ground reference layers under DDR3 routing region <sup>(1)</sup>	1			
4	Full 1.5-V power reference layers under the DDR3 routing region <sup>(1)</sup>	1			
5	Number of reference plane cuts allowed within DDR routing region <sup>(2)</sup>			0	
6	Number of layers between DDR3 routing layer and reference plane <sup>(3)</sup>			0	
7	PCB routing feature size		4		Mils
8	PCB trace width, w		4		Mils
9	PCB BGA escape via pad size <sup>(4)</sup>		18	20	Mils
10	PCB BGA escape via hole size		10		Mils
11	MPU BGA pad size		0.4		mm
13	Single-ended impedance, Z <sub>0</sub>	50		75	Ω
14	Impedance control <sup>(5)</sup>	Z-5	Z	Z+5	Ω

- (1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
- (2) No traces should cross reference plane cuts within the DDR routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
- (3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
- (4) An 18-mil pad assumes Via Channel is the most economical BGA escape. A 20-mil pad may be used if additional layers are available for power routing. An 18-mil pad is required for minimum layer count escape.
- (5) Z is the nominal singled-ended impedance selected for the PCB specified by item 13.

8.13.1.2.6 Placement

Figure 8-58 shows the required placement for the MPU as well as the DDR3 devices. The dimensions for this figure are defined in Table 8-67. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 device(s) are omitted from the placement.

Figure 8-58. Placement Specifications

PRODUCT PREVIEW

**Table 8-67. Placement Specifications**

NO.	PARAMETER	MIN	MAX	UNIT
1	X1 <sup>(1)(2)(3)</sup>		1000	Mils
2	X2 <sup>(1)(2)</sup>		600	Mils
3	Y Offset <sup>(1)(2)(3)</sup>		1500	Mils
4	DDR3 keepout region			
5	Clearance from non-DDR3 signal to DDR3 keepout region <sup>(4)(5)(6)</sup>	4		w

- (1) For dimension definitions, see [Figure 8-58](#).
- (2) Measurements from center of MPU to center of DDR3 device.
- (3) Minimizing X1 and Y improves timing margins.
- (4) w is defined as the signal trace width.
- (5) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.
- (6) Note that DDR3 signals from one DDR3 controller are considered *non-DDR3* to the other controller. In other words, keep the two DDR3 interfaces separated by this specification.

**8.13.1.2.7 DDR3 Keepout Region**

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in [Figure 8-59](#). The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in [Table 8-67](#). Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that the two DDR3 controller's signals should be separated from each other by the specification in [Table 8-67](#), item 5.

**Figure 8-59. DDR3 Keepout Region**

**8.13.1.2.8 Bulk Bypass Capacitors**

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. [Table 8-68](#) contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 device(s). Additional bulk bypass capacitance may be needed for other circuitry. Also note that [Table 8-68](#) is *per DDR3 controller*; thus, systems using both controllers have to meet the needs of [Table 8-68](#) twice, once for each controller.

PRODUCT PREVIEW

**Table 8-68. Bulk Bypass Capacitors**

NO.	PARAMETER	MIN	MAX	UNIT
1	DDR_1V5 bulk bypass capacitor count <sup>(1)</sup>	6		Devices
2	DDR_1V5 bulk bypass total capacitance	140		μF

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

### 8.13.1.2.9 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, MPU/DDR power, and MPU/DDR ground connections. Table 8-69 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limites on via sharing shown in Table 8-69.

**Table 8-69. High-Speed Bypass Capacitors**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	HS bypass capacitor package size <sup>(1)</sup>		201	402	10 Mils
2	Distance, HS bypass capacitor to MPU being bypassed <sup>(2)(3)(4)</sup>			400	Mils
3	MPU DDR_1V5 HS bypass capacitor count	70			Devices
4	MPU DDR_1V5 HS bypass capacitor total capacitance	5			μF
5	Number of connection vias for each device power/ground ball <sup>(5)</sup>				Vias
6	Trace length from device power/ground ball to connection via <sup>(2)</sup>		35	70	Mils
7	Distance, HS bypass capacitor to DDR device being bypassed <sup>(6)</sup>			150	Mils
8	DDR3 device HS bypass capacitor count <sup>(7)</sup>	12			Devices
9	DDR3 device HS bypass capacitor total capacitance <sup>(7)</sup>	0.85			μF
10	Number of connection vias for each HS capacitor <sup>(8)(9)</sup>	2			Vias
11	Trace length from bypass capacitor connect to connection via <sup>(2)(9)</sup>		35	100	Mils
12	Number of connection vias for each DDR3 device power/ground ball <sup>(10)</sup>	1			Vias
13	Trace length from DDR3 device power/ground ball to connection via <sup>(2)(8)</sup>		35	60	Mils

(1) LxW, 10-mil units, i.e., a 402 is a 40x20-mil surface-mount capacitor.

(2) Closer/shorter is better.

(3) Measured from the nearest MPU power/ground ball to the center of the capacitor package.

(4) Three of these capacitors should be located underneath the MPU, between the cluster of DDR\_1V5 balls and ground balls, between the DDR interfaces on the package.

(5) See the Via Channel™ escape for the MPU package.

(6) Measured from the DDR3 device power/ground ball to the center of the capacitor package.

(7) Per DDR3 device.

(8) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.

(9) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.

(10) Up to a total of two pairs of DDR power/ground balls may share a via.

#### 8.13.1.2.9.1 Return Current Bypass Capacitors

Use additional bypass capacitors if the return current reference plane changes due to DDR3 signals hopping from one signal layer to another. The bypass capacitor here provides a path for the return current to hop planes along with the signal. As many of these return current bypass capacitors should be used as possible. Since these are returns for signal current, the signal via size may be used for these capacitors.

### 8.13.1.2.10 Net Classes

Table 8-70 lists the clock net classes for the DDR3 interface. Table 8-71 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

**Table 8-70. Clock Net Class Definitions**

CLOCK NET CLASS	MPU PIN NAMES
CK	DDR[x]_CLK/DDR[x]_CLK
DQS0	DDR[x]_DQS[0]/DDR[x]_DQS[0]
DQS1	DDR[x]_DQS[1]/DDR[x]_DQS[1]
DQS2 <sup>(1)</sup>	DDR[x]_DQS[2]/DDR[x]_DQS[2]
DQS3 <sup>(1)</sup>	DDR[x]_DQS[3]/DDR[x]_DQS[3]

(1) Only used on 32-bit wide DDR3 memory systems.

**Table 8-71. Signal Net Class Definitions**

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	MPU PIN NAMES
ADDR_CTRL	CK	DDR[x]_BA[2:0], DDR[x]_A[14:0], DDR[x]_CS[x], DDR[x]_CAS, DDR[x]_RAS, DDR[x]_WE, DDR[x]_CKE
DQ0	DQS0	DDR[x]_D[7:0], DDR[x]_DQM[0]
DQ1	DQS1	DDR[x]_D[15:8], DDR[x]_DQM[1]
DQ2 <sup>(1)</sup>	DQS2	DDR[x]_D[23:16], DDR[x]_DQM[2]
DQ3 <sup>(1)</sup>	DQS3	DDR[x]_D[31:24], DDR[x]_DQM[3]

(1) Only used on 32-bit wide DDR3 memory systems.

### 8.13.1.2.11 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR\_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

### 8.13.1.2.12 VREFSSTL\_DDR Routing

VREFSSTL\_DDR (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the MPU. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 1.5-V and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1 μF bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

### 8.13.1.2.13 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR\_CTRL net class Thevinen terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

### 8.13.1.2.14 CK and ADDR\_CTRL Topologies and Routing Definition

The CK and ADDR\_CTRL net classes are routed similarly and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR\_CTRL. The figures in the following subsections define the terms for the routing specification detailed in Table 8-72.

8.13.1.2.14.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.13.1.2.14.1.1 CK and ADDR\_CTRL Topologies, Four DDR3 Devices

Figure 8-60 shows the topology of the CK net classes and Figure 8-61 shows the topology for the corresponding ADDR\_CTRL net classes.

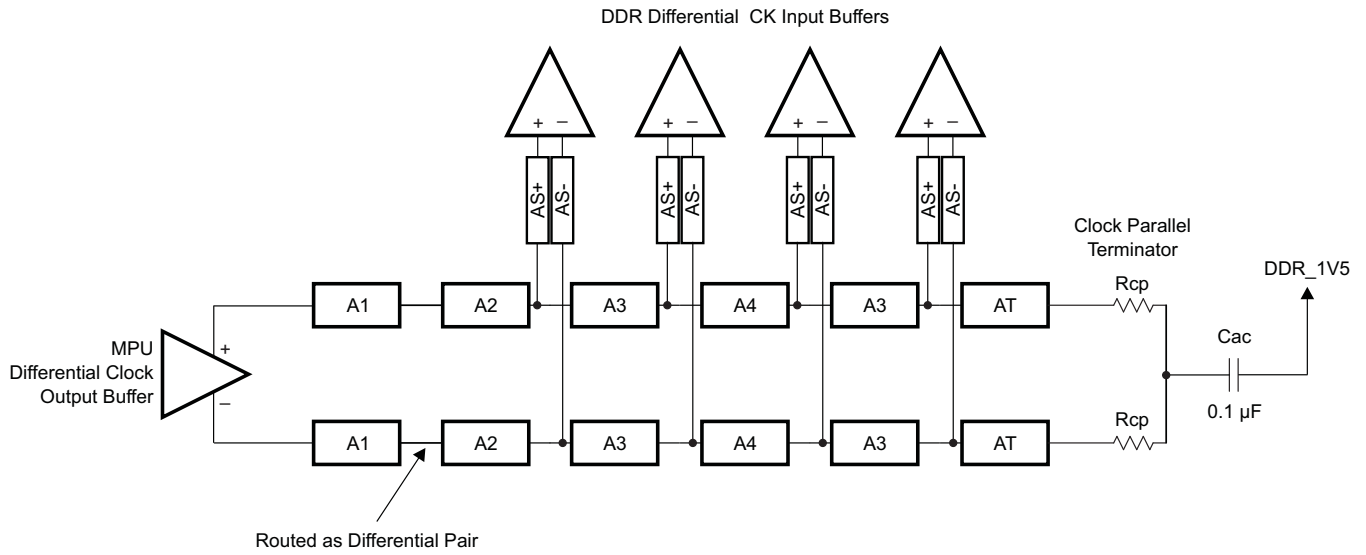

Figure 8-60. CK Topology for Four x8 DDR3 Devices

8.13.1.2.16 Routing Specification

8.13.1.2.16.1 CK and ADDR\_CTRL Routing Specification

Skew within the CK and ADDR\_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the MPU and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-80 and Figure 8-81 show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; i.e., it is based on the longest net of the CK/ADDR\_CTRL net class. For CK and ADDR\_CTRL routing, these specifications are contained in Table 8-72.

- A. It is very likely that the longest CK/ADDR\_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR\_CTRL skew matching and length control.

The length of shorter CK/ADDR\_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.  
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

Figure 8-80. CACLM for Four Address Loads on One Side of PCB

PRODUCT PREVIEW

- A. It is very likely that the longest CK/ADDR\_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR\_CTRL skew matching and length control.

The length of shorter CK/ADDR\_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.

The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

Figure 8-81. CACLM for Two Address Loads on One Side of PCB

Table 8-72. CK and ADDR\_CTRL Routing Specification<sup>(1)(2)</sup>

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	A1+A2 length			2500	mils
2	A1+A2 skew			25	mils
3	A3 length			660	mils
4	A3 skew <sup>(3)</sup>			25	mils
5	A3 skew <sup>(4)</sup>			125	mils
6	A4 length			660	mils
7	A4 skew			25	mils
8	AS length			100	mils
9	AS skew			25	mils
10	AS+/AS- length			70	mils
11	AS+/AS- skew			5	mils
12	AT length <sup>(5)</sup>		500		mils
13	AT skew <sup>(6)</sup>		100		mils
14	AT skew <sup>(7)</sup>			5	mils
15	CK/ADDR_CTRL nominal trace length <sup>(8)</sup>	CACLM-50	CACLM	CACLM+50	mils

- (1) The use of vias should be minimized.
- (2) Additional bypass capacitors are required when using the DDR\_1V5 plane as the reference plane to allow the return current to jump between the DDR\_1V5 plane and the ground plane when the net class switches layers at a via.
- (3) Non-mirrored configuration (all DDR3 memories on same side of PCB).
- (4) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).
- (5) While this length can be increased for convenience, its length should be minimized.
- (6) ADDR\_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.
- (7) CK net class only.
- (8) CACLM is the longest Manhattan distance of the CK and ADDR\_CTRL net classes + 300 mils. For definition, see Section 8.13.1.2.16.1, Figure 8-80, and Figure 8-81.

Table 8-72. CK and ADDR\_CTRL Routing Specification<sup>(1)(2)</sup> (continued)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
16	Center-to-center CK to other DDR3 trace spacing <sup>(9)</sup>	4w			
17	Center-to-center ADDR_CTRL to other DDR3 trace spacing <sup>(9)(10)</sup>	4w			
18	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing <sup>(9)</sup>	3w			
19	CK center-to-center spacing <sup>(11)</sup>				
20	CK spacing to other net <sup>(9)</sup>	4w			
21	R <sub>cp</sub> <sup>(12)</sup>	Z <sub>o-1</sub>	Z <sub>o</sub>	Z <sub>o+</sub>	Ω
22	R <sub>tt</sub> <sup>(12)(13)</sup>	Z <sub>o-5</sub>	Z <sub>o</sub>	Z <sub>o+5</sub>	Ω

(9) Center-to-center spacing is allowed to fall to minimum (w) for up to 1250 mils of routed length.

(10) The ADDR\_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.

(11) CK spacing set to ensure proper differential impedance.

(12) Source termination (series resistor at driver) is specifically not allowed.

(13) Termination values should be uniform across the net class.

8.13.1.2.16.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR\_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLM<sub>n</sub> is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0-DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0-DQLM1.

NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the MPU and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-82 shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in Table 8-73.

DB0 - DB3 represent data bytes 0 - 3.

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:

$$\begin{aligned}
 DQLM0 &= DQLMX0 + DQLMY0 \\
 DQLM1 &= DQLMX1 + DQLMY1 \\
 DQLM2 &= DQLMX2 + DQLMY2 \\
 DQLM3 &= DQLMX3 + DQLMY3
 \end{aligned}$$

Figure 8-82. DQLM for Any Number of Allowed DDR3 Devices

PRODUCT PREVIEW

**Table 8-73. Data Routing Specification<sup>(1)</sup>**

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	DB0 nominal length <sup>(2)(3)</sup>			DQLM0	mils
2	DB1 nominal length <sup>(2)(4)</sup>			DQLM1	mils
3	DB2 nominal length <sup>(2)(5)</sup>			DQLM2	mils
4	DB3 nominal length <sup>(2)(6)</sup>			DQLM3	mils
5	DBn skew <sup>(7)</sup>			25	mils
6	DQSn+ to DQSn- skew			5	mils
7	DQSn to DBn skew <sup>(7)(8)</sup>			25	mils
8	Center-to-center DBn to other DDR3 trace spacing <sup>(9)(10)</sup>	4w			
9	Center-to-center DBn to other DBn trace spacing <sup>(9)(11)</sup>	3w			
10	DQSn center-to-center spacing <sup>(12)</sup>				
11	DQSn center-to-center spacing to other net <sup>(9)</sup>	4w			

- (1) External termination disallowed. Data termination should use built-in ODT functionality.
- (2) DQLMn is the longest Manhattan distance of a byte. For definition, see [Section 8.13.1.2.16.2](#) and [Figure 8-82](#).
- (3) DQLM0 is the longest Manhattan length for the net classes of Byte 0.
- (4) DQLM1 is the longest Manhattan length for the net classes of Byte 1.
- (5) DQLM2 is the longest Manhattan length for the net classes of Byte 2.
- (6) DQLM3 is the longest Manhattan length for the net classes of Byte 3.
- (7) Length matching is only done within a byte. Length matching across bytes is neither required nor recommended.
- (8) Each DQS pair is length matched to its associated byte.
- (9) Center-to-center spacing is allowed to fall to minimum for up to 1250 mils of routed length.
- (10) Other DDR3 trace spacing means other DDR3 net classes not within the byte.
- (11) This applies to spacing within the net classes of a byte.
- (12) DQS pair spacing is set to ensure proper differential impedance.

PRODUCT PREVIEW

## 8.14 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and inter-component digital audio interface transmission (DIT).

### 8.14.1 McASP Device-Specific Information

The device includes six multichannel audio serial port (McASP) interface peripherals (McASP0, McASP1, McASP2, McASP3, McASP4, and McASP5). The McASP module consists of a transmit and receive section. On McASP0/1, these sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or, alternatively, the transmit and receive sections may be synchronized. On McASP2, McASP3, McASP4, and McASP5, the transmit and receive sections must always be synchronized. The McASP module also includes shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP peripheral supports the TDM synchronous serial format.

The McASP module can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format; however, the transmit and receive formats need not be the same. Both the transmit and receive sections of the McASP also support burst mode, which is useful for non-audio data (for example, passing control information between two devices).

The McASP peripheral has additional capability for flexible clock generation and error detection/handling, as well as error management.

The device McASP0 and McASP1 modules have up to 10 serial data pins, while McASP2, McASP3, McASP4, and McASP5 are limited to up to four serial data pins each. The McASP FIFO size is 256 bytes and two DMA and two interrupt requests are supported. Buffers are used transparently to better manage DMA, which can be leveraged to manage data flow more efficiently.

For more detailed information on and the functionality of the McASP peripheral, see the *Multichannel Audio Serial Port (McASP)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 8.14.2 McASP0, McASP1, McASP2, McASP3, McASP4, and McASP5 Peripheral Registers Descriptions

**Table 8-74. McASP0/1/2/3/4/5 Registers**

HEX ADDRESS RANGE						ACRONYM	REGISTER NAME
MCASP0	MCASP1	MCASP2	MCASP3	MCASP4	MCASP5		
0x4803 8000	0x4803 C000	0x4805 0000	0x4A1A 2000	0x4A1A 8000	0x4A1A E000	PID	Peripheral ID
0x4803 8004	0x4803 C004	0x4805 0004	0x4A1A 2004	0x4A1A 8004	0x4A1A E004	PWRIDLE SYSCONFIG	Power Idle SYSCONFIG
0x4803 8010	0x4803 C010	0x4805 0010	0x4A1A 2010	0x4A1A 8010	0x4A1A E010	PFUNC	Pin Function
0x4803 8014	0x4803 C014	0x4805 0014	0x4A1A 2014	0x4A1A 8014	0x4A1A E014	PDIR	Pin Direction
0x4803 8018	0x4803 C018	0x4805 0018	0x4A1A 2018	0x4A1A 8018	0x4A1A E018	PDOUT	Pin Data Out
0x4803 801C	0x4803 C01C	0x4805 001C	0x4A1A 201C	0x4A1A 801C	0x4A1A E01C	PDIN	Pin Data Input (Read) Read returns pin data input
					PDSET	Pin Data Set (Write) Writes effect pin data set (Alternate Write Address PDOUT)	

Table 8-74. McASP0/1/2/3/4/5 Registers (continued)

HEX ADDRESS RANGE						ACRONYM	REGISTER NAME
MCASP0	MCASP1	MCASP2	MCASP3	MCASP4	MCASP5

PRODUCT PREVIEW

8.14.3 McASP (McASP[5:0]) Electrical Data/Timing

Table 8-75. Timing Requirements for McASP<sup>(1)</sup>

(see Figure 8-83)

NO		OPP100				UNIT
		McASP[5:2,0] Only		McASP1 Only		
		MIN	MAX	MIN	MAX	
1	$t_{c(AHCLKRX)}$	Cycle time, MCA[x]_AHCLKR/X		20	20	ns
2	$t_{w(AHCLKRX)}$	Pulse duration, MCA[x]_AHCLKR/X high or low		0.5P - 3 <sup>(2)</sup>	0.5P - 3 <sup>(2)</sup>	ns
3	$t_{c(ACLKRX)}$	Cycle time, MCA[x]_ACLKR/X	Any Other Conditions	20	20	ns
			ACLKx, AFSX and AXR are all inputs	–	12.5	ns
4	$t_{w(ACLKRX)}$	Pulse duration, MCA[x]_ACLKR/X high or low	Any Other Conditions	0.5R - 3 <sup>(3)</sup>	0.5R - 3 <sup>(3)</sup>	ns
			ACLKx, AFSX and AXR are all inputs	–	0.5R - 1.5 <sup>(3)</sup>	ns
5	$t_{su}(AFSRX-ACLKRX)$	Setup time, MCA[x]_AFSR/X input valid before MCA[X]_ACLKR/X	ACLKR/X int	11.5	11.5	ns
			ACLKR/X ext in	4	2.5	
			ACLKR/X ext out	4	4	
6	$t_h(ACLKRX-AFSRX)$	Hold time, MCA[x]_AFSR/X input valid after MCA[X]_ACLKR/X	ACLKR/X int	-1	-1	ns
			ACLKR/X ext in	0.4	2.5	
			ACLKR/X ext out	0.4	2.5	
7	$t_{su}(AXR-ACLKRX)$	Setup time, MCA[x]_AXR input valid before MCA[X]_ACLKR/X	ACLKR/X int	11.5	11.5	ns
			ACLKR/X ext in	4	2	
			ACLKR/X ext out	4	4	
8	$t_h(ACLKRX-AXR)$	Hold time, MCA[x]_AXR input valid after MCA[X]_ACLKR/X	ACLKR/X int	-1	-1	ns
			ACLKR/X ext in	0.4	2	
			ACLKR/X ext out	0.4	2	

- (1) ACLKR internal: ACLKRCTL.CLKRM=1, PDIR.ACLKR = 1  
 ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0  
 ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1  
 ACLKX internal: ACLKXCTL.CLKXM=1, PDIR.ACLKX = 1  
 ACLKX external input: ACLKXCTL.CLKXM=0, PDIR.ACLKX=0  
 ACLKX external output: ACLKXCTL.CLKXM=0, PDIR.ACLKX=1
- (2) P = MCA[x]\_AHCLKR/X period in nano seconds (ns).
- (3) R = MCA[x]\_ACLKR/X period in ns.

PRODUCT PREVIEW

- A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).
- B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

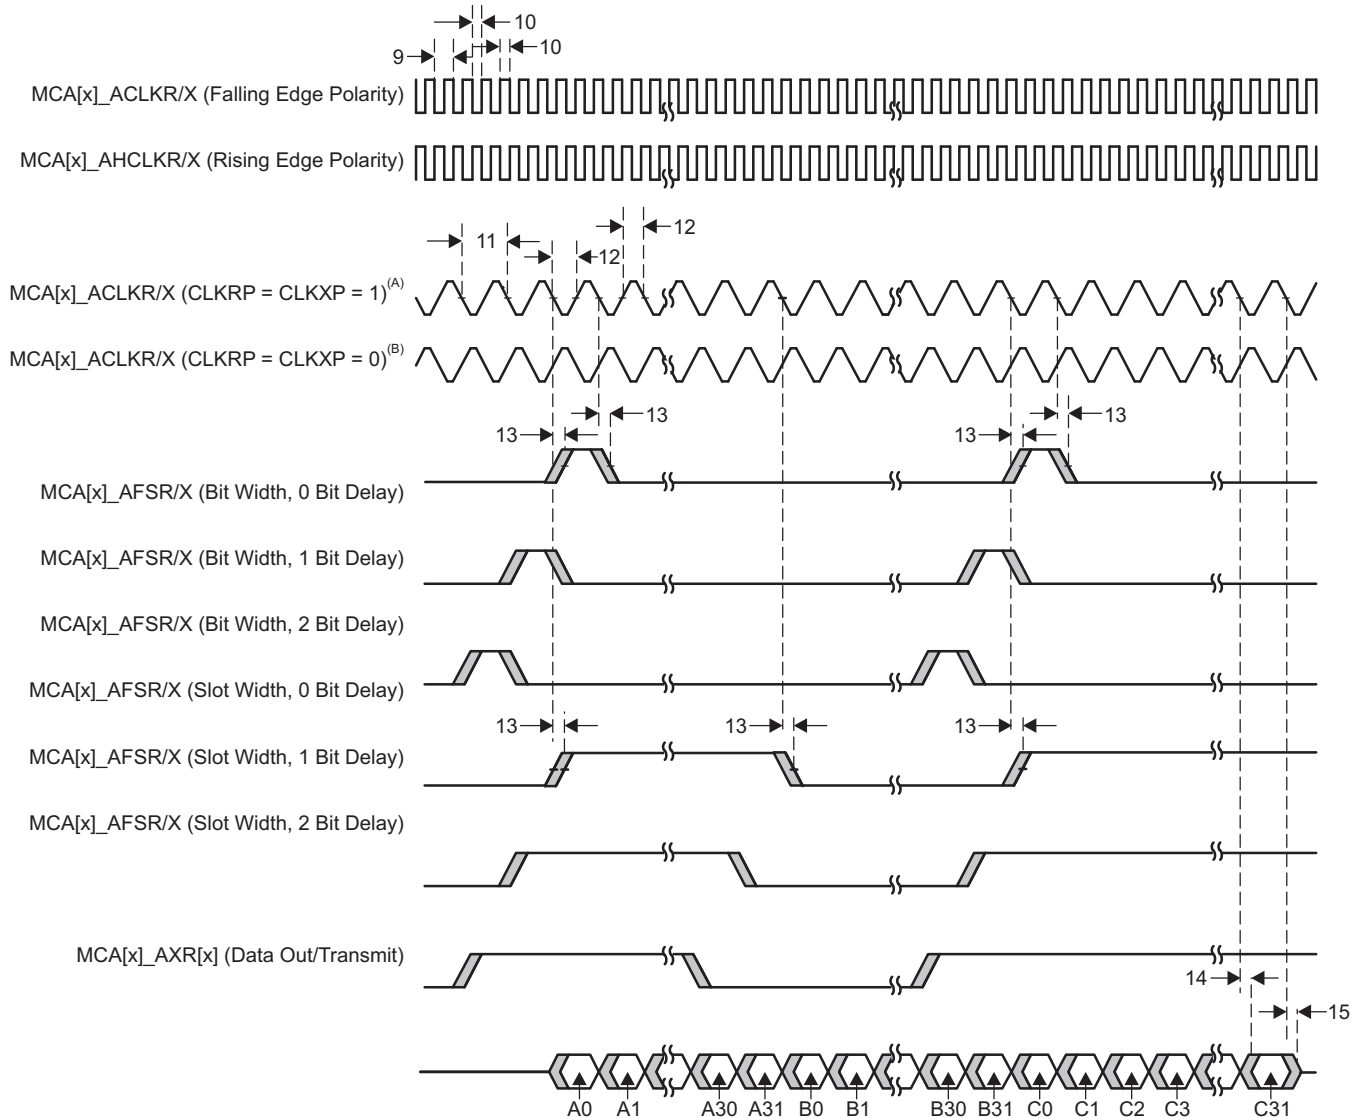

**Figure 8-83. McASP Input Timing**

- (2) 50 MHz
- (3) P = AHCLKR/X period.

- A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).
- B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 8-84. McASP Output Timing

## 8.15 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- Supports TDM, I2S, and similar formats
- External shift clock or an internal, programmable frequency shift clock for data transfer
- 5KB Tx and Rx buffer
- Supports three interrupt and two DMA requests.

The McBSP module may support two types of data transfer at the system level:

- The full-cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later).
- The half-cycle mode, for which one half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one half clock period later). Note that a new data is generated only every clock period, which secures the required hold time. The interface clock (CLKX/CLKR) activation edge (data/frame sync capture and generation) has to be configured accordingly with the external peripheral (activation edge capability) and the type of data transfer required at the system level.

For more detailed information on the McBSP peripheral, see the *Multichannel Buffered Serial Port (McBSP)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

The following sections describe the timing characteristics for applications in normal mode (that is, the McBSP connected to one peripheral) and TDM applications in multipoint mode.

### 8.15.1 McBSP Peripheral Register Descriptions

**Table 8-77. McBSP Registers<sup>(1)</sup>**

HEX ADDRESS	ACRONYM	REGISTER NAME
0x4700 0000	DRR_REG	McBSP data receive
0x4700 0008	DXR_REG	McBSP data transmit
0x4700 0010	SPCR2_REG	McBSP serial port control 2
0x4700 0014	SPCR1_REG	McBSP serial port control 1
0x4700 0018	RCR2_REG	McBSP receive control 2
0x4700 001C	RCR1_REG	McBSP receive control 1
0x4700 0020	XCR2_REG	McBSP transmit control 2
0x4700 0024	XCR1_REG	McBSP transmit control 1
0x4700 0028	SRGR2_REG	McBSP sample rate generator 2
0x4700 002C	SRGR1_REG	McBSP sample rate generator 1
0x4700 0030	MCR2_REG	McBSP multichannel 2
0x4700 0034	MCR1_REG	McBSP multichannel 1
0x4700 0038	RCERA_REG	McBSP receive channel enable partition A
0x4700 003C	RCERB_REG	McBSP receive channel enable partition B
0x4700 0040	XCERA_REG	McBSP transmit channel enable partition A
0x4700 0044	XCERB_REG	McBSP transmit channel enable partition B
0x4700 0048	PCR_REG	McBSP pin control

(1) Note that the McBSP registers are 32-bit aligned.

**Table 8-77. McBSP Registers<sup>(1)</sup> (continued)**

HEX ADDRESS	ACRONYM	REGISTER NAME
0x4700 004C	RCERC_REG	McBSP receive channel enable partition C
0x4700 0050	RCERD_REG	McBSP receive channel enable partition D
0x4700 0054	XCERC_REG	McBSP transmit channel enable partition C
0x4700 0058	XCERD_REG	McBSP transmit channel enable partition D
0x4700 005C	RCERE_REG	McBSP receive channel enable partition E
0x4700 0060	RCERF_REG	McBSP receive channel enable partition F

0x4700 0070	RCERH_REG	McBSP receive channel enable partition H
0x4700 0074	XCERG_REG	McBSP transmit channel enable partition G
0x4700 0078	XCERH_REG	McBSP transmit channel enable partition H
0x4700 007C	REV_REG	McBSP revision number
0x4700 0080	RINTCLR_REG	McBSP receive interrupt clear
0x4700 0084	XINTCLR_REG	McBSP transmit interrupt clear
0x4700 0088	ROVFLCLR_REG	McBSP receive overflow interrupt clear
0x4700 008C	SYSCONFIG_REG	McBSP system configuration
0x4700 0090	THRSH2_REG	McBSP transmit buffer threshold (DMA or IRQ trigger)
0x4700 0094	THRSH1_REG	McBSP receive buffer threshold (DMA or IRQ trigger)
0x4700 00A0	IRQSTATATUS	McBSP interrupt status (OCP compliant IRQ line)
0x4700 00A4	IRQENABLE	McBSP interrupt enable (OCP compliant IRQ line)
0x4700 00A8	WAKEUPEN	McBSP wakeup enable
0x4700 00AC	XCCR_REG	McBSP transmit configuration control
0x4700 00B0	RCCR_REG	McBSP receive configuration control
0x4700 00B4	XBUFFSTAT_REG	McBSP transmit buffer status
0x4700 00B8	RBUFFSTAT_REG	McBSP receive buffer status
0x4700 00C0	STATUS_REG	McBSP status

### 8.15.2 McBSP Electrical Data/Timing

**Table 8-78. Timing Requirements for McBSP - Master Mode<sup>(1)</sup>**

(see Figure 8-85)

NO.		OPP100		UNIT
		MIN	MAX	
6	$t_{su(DRV-CLKAE)}$ Setup time, MCB_DR valid before MCB_CLK active edge <sup>(2)</sup>	3.5		ns
7	$t_h(CLKAE-DRV)$ Hold time, MCB_DR valid after MCB_CLK active edge <sup>(2)</sup>	0.1		ns

(1) The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) MCB\_CLK corresponds to either MCB\_CLKX or MCB\_CLKR.

**Table 8-79. Switching Characteristics Over Recommended Operating Conditions for McBSP - Master Mode<sup>(1)</sup>**

(see Figure 8-85)

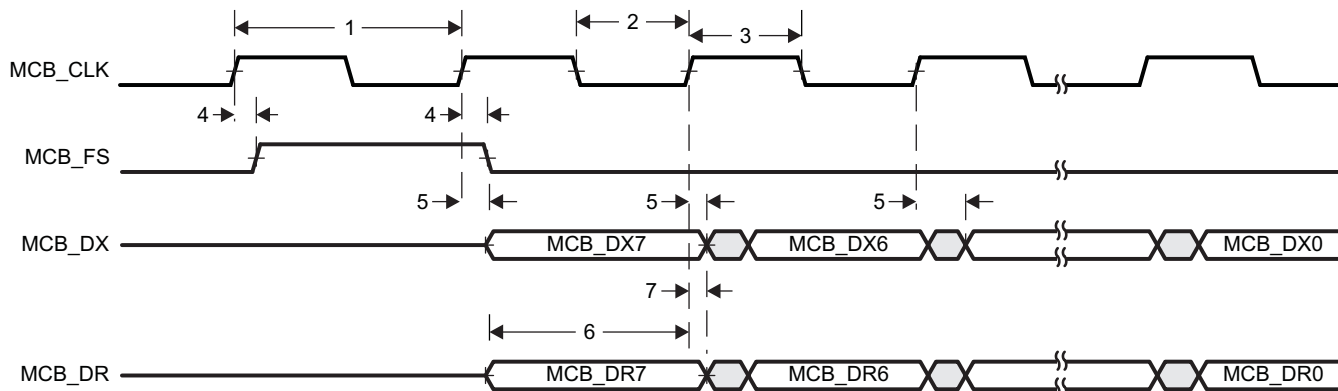

NO.	PARAMETER	OPP100		UNIT
		MIN	MAX	
1	$t_c(CLK)$ Cycle time, output MCB_CLK period <sup>(2)</sup>	20.83		ns
2	$t_w(CLKL)$ Pulse duration, output MCB_CLK low <sup>(2)</sup>	$0.5 \cdot P - 1$ <sup>(3)</sup>		ns
3	$t_w(CLKH)$ Pulse duration, output MCB_CLK high <sup>(2)</sup>	$0.5 \cdot P - 1$ <sup>(3)</sup>		ns
4	$t_d(CLKAE-FSV)$ Delay time, output MCB_CLK active edge to output MCB_FS valid <sup>(2)(4)</sup>	0.7	9.4	ns
5	$t_d(CLKXAE-DXV)$ Delay time, output MCB_CLKX active edge to output MCB_DX valid	0.7	9.4	ns

(1) The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.

(2) MCB\_CLK corresponds to either MCB\_CLKX or MCB\_CLKR.

(3)  $P = MCB\_CLKX/MCB\_CLKR$  output CLK period, in ns; use whichever value is greater. This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKX/R) in the reasonable range of 40/60 duty cycle.

(4) MCB\_FS corresponds to either MCB\_FSX or MCB\_FSR.

- A. The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.
- B. MCBSP\_CLK corresponds to either MCBSP\_CLKX or MCBSP\_CLKR; MCBSP\_FS corresponds to either MCBSP\_FSX or MCBSP\_FSR. McBSP in 6-pin mode: DX and DR as data pins; CLKX, CLKR, FSX and FSR as control pins. McBSP in 4-pin mode: DX and DR as data pins; CLKX and FSX pins as control pins. The CLKX and FSX pins are internally looped back via software configuration, respectively to the CLKR and FSR internal signals for data receive.
- C. The polarity of McBSP frame synchronization is software configurable.
- D. The active clock edge selection of MCBSP\_CLK (rising or falling) on which MCBSP\_DX data is latched and MCBSP\_DR data is sampled is software configurable.
- E. Timing diagrams are for data delay set to 1.
- F. For further details about the registers used to configure McBSP, see the *Multichannel Buffered Serial Port (McBSP)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

Figure 8-85. McBSP Master Mode Timing

Table 8-80. Timing Requirements for McBSP - Slave Mode<sup>(1)</sup>

(see Figure 8-86)

NO.	PARAMETER	OPP100		UNIT
		MIN	MAX	
1	$t_c(\text{CLK})$ Cycle time, MCB_CLK period <sup>(2)</sup>	20.83		ns
2	$t_w(\text{CLKL})$ Pulse duration, MCB_CLK low <sup>(2)</sup>	$0.5 \cdot P - 1$ <sup>(3)</sup>		ns
3	$t_w(\text{CLKH})$ Pulse duration, MCB_CLK high <sup>(2)</sup>	$0.5 \cdot P - 1$ <sup>(3)</sup>		ns
4	$t_{su}(\text{FSV-CLKAE})$ Setup time, MCB_FS valid before MCB_CLK active edge <sup>(2)(4)</sup>	3.8		ns
5	$t_h(\text{CLKAE-FSV})$ Hold time, MCB_FS valid after MCB_CLK active edge <sup>(2)(4)</sup>	0		ns
7	$t_{su}(\text{DRV-CLKAE})$ Setup time, MCB_DR valid before MCB_CLK active edge <sup>(2)</sup>	3.8		ns
8	$t_h(\text{CLKAE-DRV})$ Hold time, MCB_DR valid after MCB_CLK active edge <sup>(2)</sup>	0		ns

- (1) The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.
- (2) MCB\_CLK corresponds to either MCB\_CLKX or MCB\_CLKR.
- (3)  $P = \text{MCB\_CLKX/MCB\_CLKR output CLK period}$ , in ns; use whichever value is greater. This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKX/R) in the reasonable range of 40/60 duty cycle.
- (4) MCB\_FS corresponds to either MCB\_FSX or MCB\_FSR.

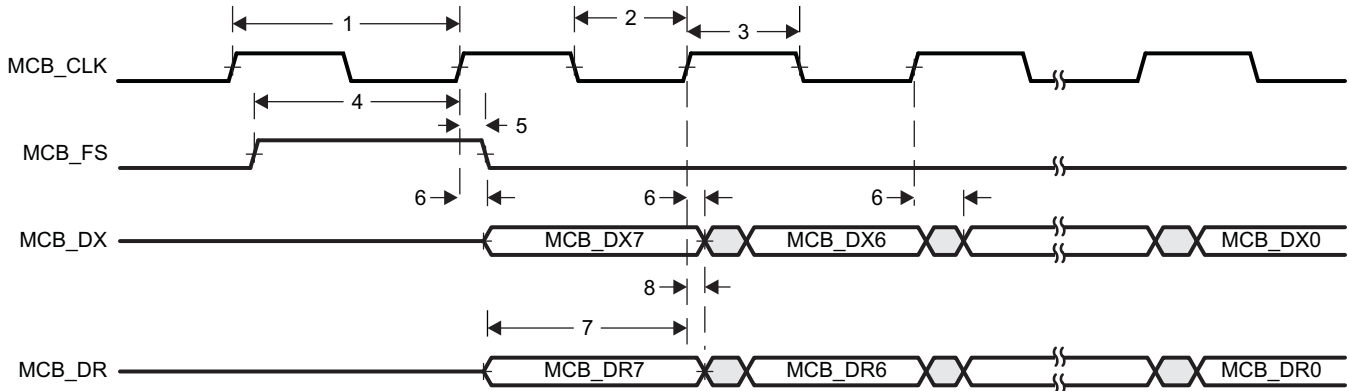

Table 8-81. Switching Characteristics Over Recommended Operating Conditions for McBSP - Slave Mode<sup>(1)</sup>

(see Figure 8-86)

NO.	PARAMETER	OPP100		UNIT
		MIN	MAX	
6	$t_d(\text{CLKXAE-DXV})$ Delay time, input MCB_CLKx active edge to output MCB_DX valid	0.5	12.5	ns

- (1) The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.

PRODUCT PREVIEW

- A. The timings apply to all configurations regardless of MCB\_CLK polarity and which clock edges are used to drive output data and capture input data.
- B. MCBSP\_CLK corresponds to either MCBSP\_CLKX or MCBSP\_CLKR; MCBSP\_FS corresponds to either MCBSP\_FSX or MCBSP\_FSR. McBSP in 6-pin mode: DX and DR as data pins; CLKX, CLKR, FSX and FSR as control pins. McBSP in 4-pin mode: DX and DR as data pins; CLKX and FSX pins as control pins. The CLKX and FSX pins are internally looped back via software configuration, respectively to the CLKR and FSR internal signals for data receive.

PRODUCT PREVIEW

## 8.16 MultiMedia Card/Secure Digital/Secure Digital Input Output (MMC/SD/SDIO)

The device includes 3 MMC/SD/SDIO Controllers which are compliant with MMC V4.3, Secure Digital Part 1 Physical Layer Specification V2.00 and Secure Digital Input Output (SDIO) V2.00 specifications.

The device MMC/SD/SDIO Controller has the following features:

- MultiMedia card (MMC)
- Secure Digital (SD) memory card
- MMC/SD protocol support
- SDIO protocol support
- Programmable clock frequency
- 1024 byte read/write FIFO to lower system overhead
- Slave EDMA transfer capability
- SD High capacity support

### 8.16.1 MMC/SD/SDIO Peripheral Register Descriptions

Table 8-82. MMC/SD/SDIO Registers<sup>(1)</sup>

MMC/SD/SDIO0 HEX ADDRESS	MMC/SD/SDIO1 HEX ADDRESS	MMC/SD/SDIO2 HEX ADDRESS	ACRONYM	REGISTER NAME

## 8.17 Peripheral Component Interconnect Express (PCIe)

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. The device implements a single one-lane PCIe 2.0 (5.0 GT/s) Endpoint/Root Complex port.

The device PCIe supports the following features:

- Supports Gen1/Gen2 in x1 or x2 mode
- One port with one 5 GT/s lane
- Single virtual channel (VC), single traffic class (TC)
- Single function in end-point mode
- Automatic width and speed negotiation and lane reversal
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management
- ECRC generation and checking
- Configurable BAR filtering
- Supports PCIe messages
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI device power management, except D3 cold with vaux
- Active state power management state L0 and L1.

For more detailed information on the PCIe port peripheral module, see the *PCI Express (PCIe) Module* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

The PCIe peripheral on the device conforms to the PCI Express Base 2.0 Specification.

### 8.17.1 PCIe Peripheral Register Descriptions

### 8.17.2 PCIe Electrical Data/Timing

Texas Instruments (TI) has performed the simulation and system characterization to ensure that the PCIe peripheral meets all AC timing specifications as required by the PCI Express Base 2.0 Specification. Therefore, the AC timing specifications are not reproduced here. For more information on the AC timing specifications, see Sections 4.3.3.5 and 4.3.4.4 of the PCI Express Base 2.0 Specification.

### 8.17.3 PCIe Design and Layout Guidelines

#### 8.17.3.1 Clock Source

A standard 100-MHz PCIe differential clock source must be used for PCIe operation (for more details, see [Section 7.4.2, SERDES CLKN/P Input Clock](#)).

#### 8.17.3.2 PCIe Connections and Interface Compliance

The PCIe interface on the device is compliant with the PCI Express Base 2.0 Specification. Refer to the PCIe specifications for all connections that are described in it. For coupling capacitor selection, see [Section 8.17.3.2.1, Coupling Capacitors](#).

The use of PCIe-compatible bridges and switches is allowed for interfacing with more than one other processor or PCIe device.

##### 8.17.3.2.1 Coupling Capacitors

AC coupling capacitors are required on the transmit data pair. [Table 8-86](#) shows the requirements for these capacitors.

**Table 8-86. AC Coupling Capacitors Requirements**

PARAMETER	MIN	TYP	MAX	UNIT
PCIe AC coupling capacitor value	75		200	nF
PCIe AC coupling capacitor package size <sup>(1)</sup>		0402	0603	EIA <sup>(2)</sup>

(1) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair, placed side by side.

(2) EIA LxW units; i.e., a 0402 is a 40x20 mil (thousandths of an inch) surface-mount capacitor.

##### 8.17.3.2.2 Polarity Inversion

The PCIe specification requires polarity inversion support. This means, for layout purposes, polarity is unimportant since each signal can change its polarity on-die inside the chip. This means polarity within a lane is unimportant for layout.

#### 8.17.3.3 Non-Standard PCIe Connections

The following sections contain suggestions for any PCIe connection that is **not** described in the official PCIe specification, such as an on-board device-to-device connection, or device-to-other PCIe-compliant processor connection.

##### 8.17.3.3.1 PCB Stackup Specifications

[Table 8-87](#) shows the stackup and feature sizes required for these types of PCIe connections.

**Table 8-87. PCIe PCB Stackup Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCB Routing/Plane Layers	4	6	-	Layers
Signal Routing Layers	2	3	-	Layers
Number of ground plane cuts allowed within PCIe routing region	-	-	0	Cuts
Number of layers between PCIe routing area and reference plane <sup>(1)</sup>	-	-	0	Layers
PCB Routing clearance	-	4	-	Mils
PCB Trace width <sup>(2)</sup>	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10	-	Mils
MPU BGA pad size <sup>(3)(4)</sup>		0.4		mm

(1) A reference plane may be a ground plane or the power plane referencing the PCIe signals.

(2) In breakout area.

(3) Non-solder mask defined pad.

(4) Per IPC-7351A BGA pad size guideline.

### 8.17.3.3.2 Routing Specifications

The PCIe data signal traces must be routed to achieve 100  $\Omega$  ( $\pm 20\%$ ) differential impedance and 60  $\Omega$  ( $\pm 15\%$ ) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. These requirements are the same as those recommended in the *PCIe Motherboard Checklist 1.0* document, available from PCI-SIG.

These impedances are impacted by trace width, trace spacing, distance between signals and referencing planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs result in as close to 100  $\Omega$  differential impedance and 60  $\Omega$  single-ended impedance as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations do not affect impedance as much; therefore, it is easier to maintain an accurate impedance over the length of the signal. The wider traces also show reduced skin effect and, therefore, often result in better signal integrity.

Table 8-88 shows the routing specifications for the PCIe data signals.

**Table 8-88. PCIe Routing Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCIe signal trace length			10 <sup>(1)</sup>	Inches
Differential pair trace matching			10 <sup>(2)</sup>	Mils
Number of stubs allowed on PCIe traces <sup>(3)</sup>			0	Stubs
TX/RX pair differential impedance	80	100	120	$\Omega$
TX/RX single ended impedance	51	60	69	$\Omega$
Pad size of vias on PCIe trace			25 <sup>(4)</sup>	Mils
Hole size of vias on PCIe trace			14	Mils
Number of vias on each PCIe trace			3	Vias <sup>(5)</sup>

(1) Beyond this, signal integrity may suffer.

(2) For example, RXP0 within 10 Mils of RXN0.

(3) In-line pads may be used for probing.

(4) 35-Mil antipad max recommended.

(5) Vias must be used in pairs with their distance minimized.

**Table 8-88. PCIe Routing Specifications (continued)**

PARAMETER	MIN	TYP	MAX	UNIT
PCIe differential pair to any other trace spacing	2*DS <sup>(6)</sup>			

(6) DS = differential spacing of the PCIe traces.

**PRODUCT PREVIEW**

## 8.18 Serial ATA Controller (SATA)

The Serial ATA (SATA) peripheral provides a direct interface to one hard disk drive (SATA 300) or up to 15 hard disk drives using a Port Multiplier and supports the following features:

- Serial ATA 1.5 Gbps and 3 Gbps speeds
- Integrated PHY
- Integrated Rx and Tx data buffers
- Supports all SATA power management features
- Hardware-assisted native command queuing (NCQ) for up to 32 entries
- Supports port multiplier with command-based switching
- Activity LED support.

### 8.18.1 SATA Peripheral Register Descriptions

**8.18.2 SATA Interface Design Guidelines**

This section provides PCB design and layout guidelines for the SATA interface. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. Simulation and system design work has been done to ensure the SATA interface requirements are met.

A standard 100-MHz differential clock source must be used for SATA operation (for details, see [Section 7.4.2, SERDES\\_CLKN/P Input Clock](#)).

**8.18.2.1 SATA Interface Schematic**

[Figure 8-91](#) shows the data portion of the SATA interface schematic. The specific pin numbers can be obtained from [Table 3-26, Serial ATA Terminal Functions](#).

**Figure 8-91. SATA Interface High-Level Schematic**

PRODUCT PREVIEW

### 8.18.2.2 Compatible SATA Components and Modes

Table 8-90 shows the compatible SATA components and supported modes. Note that the only supported configuration is an internal cable from the processor host to the SATA device.

**Table 8-90. SATA Supported Modes**

PARAMETER	MIN	MAX	UNIT	SUPPORTED
Transfer Rates	1.5	3.0	Gbps	
xSATA	-	-	-	No
Backplane	-	-	-	No
Internal Cable (iSATA)	-	-	-	Yes

### 8.18.2.3 PCB Stackup Specifications

Table 8-91 shows the PCB stackup and feature sizes required for SATA.

**Table 8-91. SATA PCB Stackup Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
PCB routing/plane layers	4	6	-	Layers
Signal routing layers	2	3	-	Layers
Number of ground plane cuts allowed within SATA routing region	-	-	0	Cuts
Number of layers between SATA routing region and reference ground plane	-	-	0	Layers
PCB trace width, w	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10	-	Mils
MPU BGA pad size <sup>(1)</sup>		0.4		mm

(1) NSMD pad, per IPC-7351A BGA pad size guideline.

### 8.18.2.4 Routing Specifications

The SATA data signal traces must be routed to achieve 100  $\Omega$  ( $\pm 20\%$ ) differential impedance and 60  $\Omega$  ( $\pm 15\%$ ) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. 60  $\Omega$  is chosen for the single-ended impedance to minimize problems caused by too low an impedance.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 100  $\Omega$  differential impedance and 60  $\Omega$  single-ended impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

Table 8-92 shows the routing specifications for the SATA data signals.

**Table 8-92. SATA Routing Specifications**

PARAMETER	MIN	TYP	MAX	UNIT
MPU-to-SATA header trace length			10 <sup>(1)</sup>	Inches
Number of stubs allowed on SATA traces <sup>(2)</sup>			0	Stubs
TX/RX pair differential impedance	80	100	120	$\Omega$
TX/RX single ended impedance	51	60	69	$\Omega$
Number of vias on each SATA trace			3	Vias <sup>(3)</sup>
SATA differential pair to any other trace spacing	2*DS <sup>(4)</sup>			

(1) Beyond this, signal integrity may suffer.

(2) In-line pads may be used for probing.

(3) Vias must be used in pairs with their distance minimized.

(4) DS = differential spacing of the SATA traces.

### 8.18.2.5 Coupling Capacitors

AC coupling capacitors are required on the receive data pair. [Table 8-93](#) shows the requirements for these capacitors.

**Table 8-93. SATA AC Coupling Capacitors Requirements**

PARAMETER	MIN	TYP	MAX	UNIT
SATA AC coupling capacitor value	1	10	12	nF
SATA AC coupling capacitor package size <sup>(1)</sup>		0402	0603	EIA <sup>(2)</sup>

(1) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair, placed side by side.

(2) EIA LxW units; i.e., a 0402 is a 40 x 20 mil surface-mount capacitor.

## 8.19 Serial Peripheral Interface (SPI)

The SPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (4 to 32 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The SPI is normally used for communication between the device and external peripherals. Typical applications include an interface-to-external I/O or peripheral expansion via devices such as shift registers, display drivers, SPI EEPROMs, and Analog-to-Digital Converters (ADCs).

The SPI supports the following features:

- Master/Slave operation
- Four chip selects for interfacing/control to up to four SPI Slave devices and connection to a single external Master
- 32-bit shift register
- Buffered receive/transmit data register per channel (1 word deep), FIFO size is 64 bytes
- Programmable SPI configuration per channel (clock definition, enable polarity and word width)
- Supports one interrupt request and two DMA requests per channel.

For more detailed information on the SPI, see the *Multichannel Serial Port Interface (McSPI)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

### 8.19.1 SPI Peripheral Register Descriptions

Table 8-94. SPI Registers

HEX ADDRESS RANGE				ACRONYM	REGISTER NAME

- (1) This timing applies to all configurations regardless of SPI\_CLK polarity and which clock edges are used to drive output data and capture input data.
- (2) Related to the SPI\_CLK maximum frequency.
- (3) Maximum frequency = 48 MHz
- (4) P = SPICLK period.
- (5) SPI\_CLK phase is programmable with the PHA bit of the SPI\_CH(i)CONF register.
- (6) B = (TCS + 0.5) \* TSPICLKREF \* F<sub>ratio</sub>, where TCS is a bit field of the SPI\_CH(i)CONF register and F<sub>ratio</sub> = Even ≥ 2.
- (7) When P = 20.8 ns, A = (TCS + 1) \* TSPICLKREF, where TCS is a bit field of the SPI\_CH(i)CONF register. When P > 20.8 ns, A = (TCS + 0.5) \* F<sub>ratio</sub> \* TSPICLKREF, where TCS is a bit field of the SPI\_CH(i)CONF register.
- (8) Maximum frequency = 24 MHz

## 8.20 Timers

The device has eight 32-bit general-purpose (GP) timers (TIMER8 - TIMER1) that have the following features:

- TIMER8, TIMER1 are for software use and do not have an external connection
- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
  - Compare and capture modes
  - Auto-reload mode
  - Start-stop mode
- TIMER[8:1] functional clock is sourced from either the DEVOSC, AUXOSC, AUD\_CLK2/1/0, TCLKIN, or SYSClk18 27 MHz as selected by the timer clock multiplexers.
- On-the-fly read/write register (while counting)
- Generates interrupts to the ARM and Media Controller.

The device has one system watchdog timer that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition
- The system watchdog timer has two possible clock sources:
  - RCOSC32K oscillator
  - RTCDIVIDER
- 

The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

For more detailed information, see the *TMS320DM814x DMSoC 32-Bit Timers User's Guide* (TBD).

### 8.20.1 Timer Peripheral Register Descriptions

Table TBD and Table TBD show the registers for the Timers 1-8 and the Watchdog Timer (WDT0).

PRODUCT PREVIEW

## 8.21 Universal Asynchronous Receiver/Transmitter (UART)

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. The device provides up to six UART peripheral interfaces, depending on the selected pin multiplexing.

Each UART has the following features:

- Selectable UART/IrDA (SIR/MIR)/CIR modes
- Dual 64-entry FIFOs for received and transmitted data payload
- Programmable and selectable transmit and receive FIFO trigger levels for DMA and interrupt generation
- Baud-rate generation based upon programmable divisors N (N=1...16384)
- Two DMA requests and one interrupt request to the system
- Can connect to any RS-232 compliant device.

UART functions include:

- Baud-rate up to 3.6 Mbit/s on UART0, UART1, and UART2
- Baud-rate up to 12 Mbit/s on UART3, UART4, and UART5
- Programmable serial interfaces characteristics
  - 5, 6, 7, or 8-bit characters
  - Even, odd, or no parity-bit generation and detection
  - 1, 1.5, or 2 stop-bit generation
  - Flow control: hardware (RTS/CTS) or software (XON/XOFF)
- Additional modem control functions (UART0\_DTR, UART0\_DSR, UART0\_DCD, and UART0\_RIN) for UART0 only; UART1, UART2, UART3, UART4, and UART5 do not support full-flow control signaling.

IR-IrDA functions include:

- Support of IrDA 1.4 slow infrared (SIR, baud-rate up to 115.2 Kbits/s), medium infrared (MIR, baud-rate up to 1.152 Mbits/s) and fast infrared (FIR baud-rate up to 4.0 Mbits/s) communications
- Supports framing error, cyclic redundancy check (CRC) error, illegal symbol (FIR), and abort pattern (SIR, MIR) detection
- 8-entry status FIFO (with selectable trigger levels) available to monitor frame length and frame errors.

IR-CIR functions include:

- Consumer infrared (CIR) remote control mode with programmable data encoding
- Free data format (supports any remote control private standards)
- Selectable bit rate and configurable carrier frequency.

For more detailed information on the UART peripheral, see the *TMS320DM814x DMSoc Universal Asynchronous Receiver/Transmitter (UART) User's Guide* (TBD).

### 8.21.1 UART Peripheral Register Descriptions

### 8.21.2 UART Electrical/Data Timing

**Table 8-99. Timing Requirements for UART**

(see Figure 8-97)

NO.			OPP100		UNIT
			MIN	MAX	
4	$t_{w(RX)}$	Pulse width, receive data bit, 15/30/100pF high or low	$0.96U^{(1)}$	$1.05U^{(1)}$	ns
5	$t_{w(CTS)}$	Pulse width, receive start bit, 15/30/100pF high or low	$0.96U^{(1)}$	$1.05U^{(1)}$	ns
	$t_{d(RTS-TX)}$	Delay time, transmit start bit to transmit data	$P^{(2)}$		ns
	$t_{d(CTS-TX)}$	Delay time, receive start bit to transmit data	$P^{(2)}$		ns

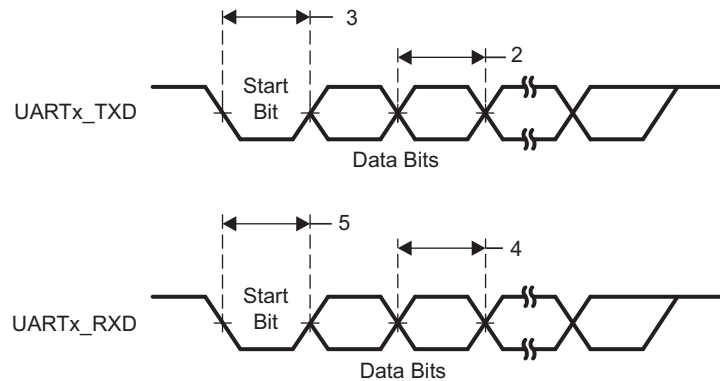

- (1) U = UART baud time = 1/programmed baud rate
- (2) P = Clock period of the reference clock (FCLK, usually 48 MHz).

**Table 8-100. Switching Characteristics Over Recommended Operating Conditions for UART**

(see Figure 8-97)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
	$f_{(baud)}$	Maximum programmable baud rate	15 pF (UART0/1/2)	5	MHz
			15 pF (UART3/4/5)	12	
			30 pF	0.23	
			100 pF	0.115	
2	$t_{w(TX)}$	Pulse width, transmit data bit, 15/30/100 pF high or low	$U - 2^{(1)}$	$U + 2^{(1)}$	ns
3	$t_{w(RTS)}$	Pulse width, transmit start bit, 15/30/100 pF high or low	$U - 2^{(1)}$	$U + 2^{(1)}$	ns

- (1) U = UART baud time = 1/programmed baud rate

**Figure 8-97. UART Timing**

PRODUCT PREVIEW

## 8.22 Universal Serial Bus (USB2.0)

The device includes two USB2.0 modules which support the *Universal Serial Bus Specification Revision 2.0*. The following are some of the major USB features that are supported:

- USB 2.0 peripheral at high speed (HS: 480 Mbps) and full speed (FS: 12 Mbps)
- USB 2.0 host at HS, FS, and low speed (LS: 1.5 Mbps)
- Each endpoint (other than endpoint 0, control only) can support all transfer modes (control, bulk, interrupt, and isochronous)
- Supports high-bandwidth ISO mode
- Supports 16 Transmit (TX) and 16 Receive (RX) endpoints including endpoint 0
- FIFO RAM
  - 32K endpoint
  - Programmable size
- Includes two integrated PHYs
- RNDIS-like mode for terminating RNDIS-type protocols without using short-packet termination for support of MSC applications.
- USB OTG extensions, i.e. session request protocol (SRP) and host negotiation protocol (HNP)

The USB2.0 peripherals do not support the following features:

- On-chip charge pump (VBUS Power must be generated external to the device.)
- RNDIS mode acceleration for USB sizes that are not multiples of 64 bytes
- Endpoint max USB packet sizes that do not conform to the USB 2.0 spec (for FS/LS: 8, 16, 32, 64, – and 1023 are defined; for HS: 64, 128, 512, and 1024 are defined)

For more detailed information on the USB2.0 peripheral, see the *Universal Serial Bus (USB)* chapter of the *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual* (Literature Number: [SPRUGZ7](#)).

- (1) Low Speed:  $C_L = 200$  pF, Full Speed:  $C_L = 50$  pF, High Speed:  $C_L = 50$  pF
- (2)  $t_{RFM} = (t_r/t_f) \times 100$ . [Excluding the first transaction from the Idle state.]
- (3) For more detailed information, see the Universal Serial Bus Specification Revision 2.0, Chapter 7, *Electrical*.
- (4)  $t_{j_r} = t_{px(1)} - t_{px(0)}$
- (5) Must accept as valid EOP.

Figure 8-98. USB2.0 Integrated Transceiver Interface Timing

For more detailed information on USB2.0 board design, routing, and layout guidelines, see the *USB 2.0 Board Design and Layout Guidelines* Application Report (Literature Number: [SPRAAR7](#)).

PRODUCT PREVIEW

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of AM387x MPU applications:

**Software Development Tools:** Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software, which provides the basic run-time target software needed to support any Sitara ARM MPU application.

**Hardware Development Tools:** Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the AM387x Sitara™ ARM MPU platform, visit the Texas Instruments website at [www.ti.com](http://www.ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

#### 9.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MPUs and support tools. Each device has one of three prefixes: X, P, or null (no prefix) [e.g., XAM3874BCYE]. Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices/tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, CYE), the temperature range (for example, "Blank" is the default commercial temperature range), and the device speed range, in megahertz (for example, "Blank" is the default).

Figure 9-1 provides a legend for reading the complete device name for any AM387x MPU platform member.

For device part numbers and further ordering information of AM387x devices in the CYE package type, see the TI website ([www.ti.com](http://www.ti.com)) or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the *AM387x Sitara™ ARM Processors Silicon Errata (Silicon Revision 2.1)* (Literature Number: [SPRZ345](http://www.ti.com/lit/zip/SRZ345)).

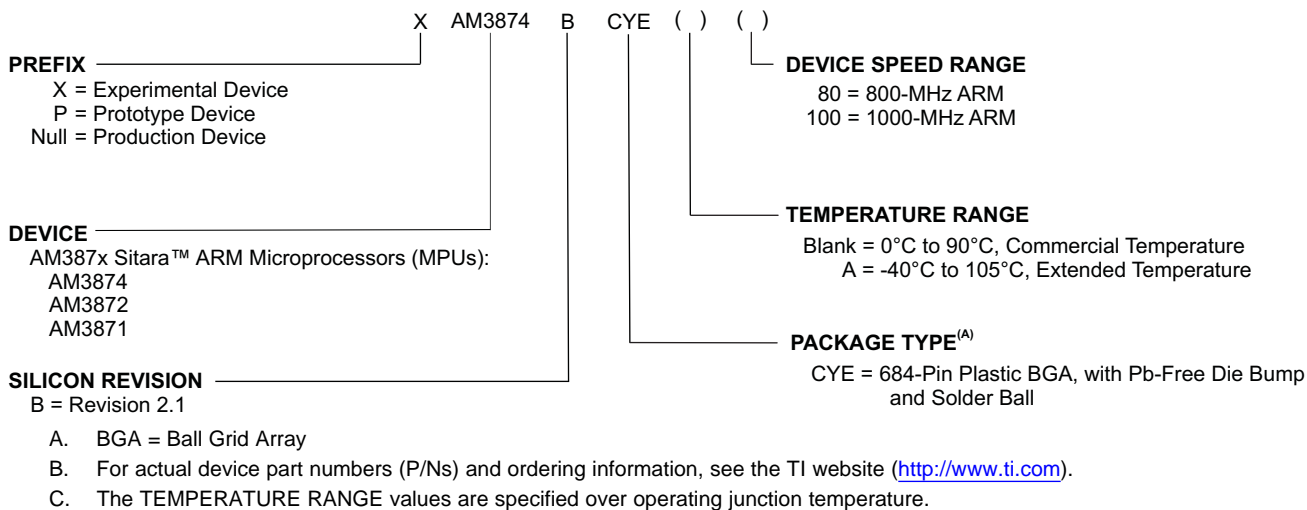

Figure 9-1. Device Nomenclature<sup>(B)(C)</sup>

## 9.2 Documentation Support

The following document describes the AM387x Sitara™ ARM MPUs.

[SPRUGZ7](#) *AM387x Sitara ARM Microprocessors (MPUs) Technical Reference Manual.*

## 9.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E Community](#) *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[TI Embedded Processors Wiki](#) *Texas Instruments Embedded Processors Wiki.* Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

## 10 Mechanical

The device package has been specially engineered with a new technology called Via Channel™. This allows larger than normal PCB via sizes and reduced PCB signal layers to be used in a PCB design with this 0.8-mm pitch package, and will substantially reduce PCB costs. It allows PCB routing in only two signal layers (four layers total) due to the increased layer efficiency of the Via Channel™ BGA technology.

### 10.1 Thermal Data for CYE-04 (Top Hat)

**Table 10-1. Thermal Resistance Characteristics (PBGA Package) [CYE-04] (Thinner Top Hat)**

NO.			°C/W <sup>(1)</sup>	AIR FLOW (m/s) <sup>(2)</sup>
1	R $\theta_{JC}$	Junction-to-case	0.39	N/A
2	R $\theta_{JB}$	Junction-to-board	3.87	N/A
3	R $\theta_{JA}$	Junction-to-free air	11.67	0.00
5	R $\theta_{JMA}$	Junction-to-moving air	8.59	1.00
6			7.80	2.00
7			7.33	3.00
8	P $\psi_{JT}$	Junction-to-package top	0.19	0.00
10			0.20	1.00
11			0.20	2.00
12			0.21	3.00
13	P $\psi_{JB}$	Junction-to-board	3.44	0.00
15			3.37	1.00
16			3.26	2.00
17			3.17	3.00

(1) These measurements were conducted in a JEDEC defined 2S2P system (with the exception of the Theta JC [R $\theta_{JC}$ ] measurement, which was conducted in a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:

- JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Packages*

Power dissipation of 2 W and an ambient temperature of 70°C is assumed.

(2) m/s = meters per second

### 10.2 Packaging Information

The following packaging information and addendum reflects the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

CYE (S-PBGA-N684)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Flip chip application only.
  - D. Thermally enhanced plastic package with lid.
  - E. Pb-free die bump and solder ball.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
