LT1316
Micropower DC/DC Converter with Programmable Peak Current Limit

## feATURES

- Precise Control of Peak Switch Current
- Quiescent Current:
$33 \mu A$ in Active Mode
$3 \mu \mathrm{~A}$ in Shutdown Mode
- Low-Battery Detector Active in Shutdown
- Low Switch $V_{\text {CESAT: }} 300 \mathrm{mV}$ at 500 mA
- 8-Lead MSOP and SO Packages
- Operates with $\mathrm{V}_{\mathbb{N}}$ as Low as 1.5 V
- Logic Level Shutdown Pin

## APPLICATIONS

- Battery Backup
- LCD Bias
- Low Power -48 V to $5 \mathrm{~V} / 3.3 \mathrm{~V}$ Converters

## DESCRIPTION

The $\mathrm{LT}^{\circledR} 1316$ is a micropower step-up DC/DC converter that operates from an input voltage as low as 1.5 V . A programmable input current limiting function allows precise control of peak switch current. Peak switch current can be set to any value between 30 mA and 500 mA by adjusting one resistor. This is particularly useful for DC/DC converters operating from high source impedance inputs such as lithium coin cells or telephone lines.
The fixed off-time, variable on-time regulation scheme results in quiescent current of only $33 \mu \mathrm{~A}$ in active mode. Quiescent current decreases to $3 \mu \mathrm{~A}$ in shutdown with the low-battery detector still active.
The LT1316 is available in 8-lead MSOP and SO packages.

## PIn fUnCTIOnS

LBO (Pin 1): Low-Battery Detector Output. Open collector can sink up to $500 \mu \mathrm{~A}$. Low-battery detector remains active in shutdown mode.

LBI (Pin 2): Low-Battery Detector Input. When voltage at this pin drops below 1.17V, LBO goes low.
$\mathbf{R}_{\text {SET }}$ (Pin 3): A resistor between $\mathrm{R}_{\text {SET }}$ and GND programs peak switch current. The resistor value should be between 3k and 150k. Do not float or short to ground. This is a high impedance node. Keep traces at this pin as short as possible. Do not put capacitance at this pin.
GND (Pin 4): Ground. Connect directly to ground plane.

SW (Pin 5): Collector of NPN Power Transistor. Keep traces at this pin as short as possible.
$V_{\text {IN }}$ (Pin 6): Input Supply. Must be bypassed close to the pin.
$\overline{\text { SHDN }}$ (Pin 7): Shutdown. Ground this pin to place the part in shutdown mode (only the low-battery detector remains active). Tie to a voltage between 1.4 V and 6 V to enable the device. $\overline{\text { SHDN }}$ pin is logic level and need only meet the logic specification (1.4V for high, 0.4 V for low).
FB (Pin 8): Feedback Pin. Reference voltage is 1.23 V . Connect resistive divider tap here. Minimize trace area at FB. Set $\mathrm{V}_{\text {OUT }}$ according to: $\mathrm{V}_{\text {OUT }}=1.23 \mathrm{~V}(1+\mathrm{R} 1 / \mathrm{R} 2)$.

## BLOCK DIAGRAM

Figure 1. LT1316 Block Diagram

## APPLLCATIONS INFORMATION

Table 1 simplifies component selection for commonly used input and output voltages. The methods used in determining these values are discussed in more detail later in this data sheet.
$V_{\text {OUT }}$ can be set using the equation:

$$
V_{\text {OUT }}=1.23\left(\frac{\mathrm{R} 2+\mathrm{R} 1}{\mathrm{R} 2}\right)
$$

## Operation

To understand operation of the LT1316, first examine Figure 1. Comparator A1 monitors FB voltage which is $V_{\text {OUT }}$ divided down by resistor divider network R1/R2. When voltage at the FB pin drops below the reference voltage (1.23V), A1's output goes high and the oscillator is enabled. The oscillator has an off-time fixed at $2 \mu \mathrm{~s}$ and an on-time limited to $6.3 \mu \mathrm{~s}$. Power transistor Q1 is cycled on and off by the oscillator forcing current through the inductor to alternately ramp up and down (see Figure 2).

Figure 2. Switching Waveforms

During the portion of the switch cycle when Q1 is turned off, current is forced through D1 to C1 causing output voltage to rise. This switching action continues until output voltage rises enough to overcome A1's hysteresis.

Peak switch current is set by a resistor from the $\mathrm{R}_{\text {SET }}$ pin to ground. Voltage at the $\mathrm{R}_{\text {SET }}$ pin is forced to 0.5 V by A4 and is used to set up a constant current through R5. This current also flows through R3 which sets the voltage at the positive input of comparator A2. When Q1 turns on, the SW pin goes low and current ramps up at the rate $\mathrm{V}_{\mathrm{IN}} / \mathrm{L}$. Current through Q2 is equal to Q1's current divided by 200. When current through Q2 causes the voltage drop across R4 and R3 to be equal, A2 changes state and resets the oscillator, causing Q1 to turn off. Shutdown is accomplished by grounding the SHDN pin.
The low-battery detector A3 has its own 1.17 V reference and is always on. The open collector output device can sink up to $500 \mu \mathrm{~A}$. Approximately 35 mV of hysteresis is built into A3 to reduce "buzzing" as the battery voltage reaches the trip level.

## Current Limit

During active mode when the part is switching, current in the inductor ramps up each switch cycle until reaching a preprogrammed current limit. This current limit value must be set by placing the appropriate resistor from the $R_{\text {SET }}$ pin to ground. This resistance value can be found by using Figure 3 to locate the desired DC current limit and

Figure 3. DC Current Limit vs R SET $^{\text {Resistor }}$ Note: DC Current is the Peak Switch Current if the Power Transistor had Zero Turn-Off Delay

## APPLLCATIONS INFORMATION

then adding in the amount of overshoot that will occur due to turn-off delay of the power transistor. This turn-off delay is approximately 300 ns .

Peak switch current = DC current limit from graph + $\mathrm{V}_{\text {IN }} /$ L(turn-off delay)

## Example:

Set peak switch current to 100 mA for: $\mathrm{V}_{\mathrm{IN}}=2 \mathrm{~V}$, $\mathrm{L}=33 \mu \mathrm{H}$
Overshoot $=\mathrm{V}_{\text {IN }} /$ L(turn-off delay) $=(2 / 33 \mu \mathrm{H})(300 \mathrm{~ns})$ $=18.2 \mathrm{~mA}$
Refer to $R_{\text {SET }}$ graph and locate
$(100 \mathrm{~mA}-18.2 \mathrm{~mA}) \approx 82 \mathrm{~mA}$
$\mathrm{R}_{\text {SET }} \approx 33 \mathrm{k}$

## Calculating Duty Cycle

For a boost converter running in continuous conduction mode, duty cycle is constrained by $\mathrm{V}_{\text {IN }}$ and $\mathrm{V}_{\text {OUT }}$ according to the equation:

$$
D C=\frac{V_{O U T}-V_{I N}+V_{D}}{V_{O U T}-V_{S A T}+V_{D}}
$$

where $\mathrm{V}_{\mathrm{D}}=$ diode voltage drop $\approx 0.4 \mathrm{~V}$ and $\mathrm{V}_{\text {SAT }}=$ switch saturation voltage $\approx 0.2 \mathrm{~V}$.
If the duty cycle exceeds the LT1316's minimum specified duty cycle of 0.73 , the converter cannot operate in continuous conduction mode and must be designed for discontinuous mode operation.

## Inductor Selection and Peak Current Limit for Continuous Conduction Mode

Peak current and inductance determine available output power. Both must be chosen properly. If peak current or inductance is increased, output power increases. Once output power or current and duty cycle are known, peak current can be set by the following equation, assuming continuous mode operation:

$$
\begin{equation*}
I_{\text {PEAK }}=\frac{2\left(I_{O U T}\right)}{1-D C} \tag{1}
\end{equation*}
$$

Inductance can now be calculated using the peak current:

$$
\begin{equation*}
\mathrm{L}=\frac{\mathrm{V}_{\text {OUT }}-\mathrm{V}_{\text {IN }}+\mathrm{V}_{\mathrm{D}}}{0.4\left(\mathrm{I}_{\text {PEAK }}\right)}\left(\mathrm{t}_{\text {OFF }}\right) \tag{2}
\end{equation*}
$$

where $\mathrm{t}_{\text {OFF }}=2 \mu \mathrm{~s}$ and $\mathrm{V}_{\mathrm{D}}=0.4 \mathrm{~V}$.
As a result of equations 1 and 2, ripple current during switching will be $40 \%$ of the peak current (see Figure 2). Using these equations at the specified $\mathrm{I}_{\mathrm{OUT}}$, the part is delivering approximately $60 \%$ of its maximum output power. In other words, the part is operating on a $40 \%$ reserve. This is a safe margin to use and can be decreased if input voltage and output current are tightly controlled.
For some applications, this recommended inductor size may be too large. Inductance can be reduced but available output power will decrease. Also, ripple current during switching will increase and may cause discontinuous operation. Discontinuous operation occurs when inductor current ramps down to zero at the end of each switch cycle (see Figure 4). Shown in Figure 5 is minimum inductance vs peak current for the part to remain in continuous mode.

Figure 4. Discontinuous Mode Operation

1316 F05
Figure 5. Minimum Inductance vs Peak Current for Continuous Mode Operation

## APPLICATIONS INFORMATION

## Discontinuous Mode Operation

A boost converter with a high $\mathrm{V}_{\text {OUT }}: \mathrm{V}_{\text {IN }}$ ratio operates with a high duty cycle in continuous mode. For duty cycles exceeding the LT1316's guaranteed minimum specification of 0.73 , the circuit will need to be designed for discontinuous operation. Additionally, very low peak current limiting below 50 mA may necessitate operating in this mode unless high inductance values are acceptable. When operating in discontinuous mode, a different equation governs available output power. For each switch cycle, the inductor current ramps down to zero, completely releasing the stored energy. Energy stored in the inductor at any time is equal to $1 / 2 \mathrm{LI}^{2}$. Because this energy is released each cycle, the equation for maximum power out is:

$$
\begin{aligned}
& \text { POUT(MAX) }_{=}^{=1 / 2 L\left(I_{\text {PEAK }}{ }^{2}\right)^{\prime}} \\
& \text { Where } f=\left(\frac{1}{\frac{I_{\text {PEAK }}(L)}{V_{\text {IN }}-V_{S A T}}+\mathrm{t}_{\text {OFF }}}\right)
\end{aligned}
$$

When designing for very low peak currents ( $<50 \mathrm{~mA}$ ), the inductor size needs to be large enough so that on-time is a least $1 \mu \mathrm{~s}$. On-time can be calculated by the equation:

$$
\text { On-Time }=\left(\frac{\mathrm{I}_{\mathrm{PEAK}} \cdot \mathrm{~L}}{\left(\mathrm{~V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{SAT}}\right)}\right)
$$

where $\mathrm{V}_{\mathrm{SAT}}=0.2 \mathrm{~V}$.
Also, at these low current levels, current overshoot due to power transistor turn-off delay will be a significant portion of peak current. Increasing inductor size will keep this to a minimum.

## Design Example 1

Requirements: $\mathrm{V}_{\text {IN }}=2 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=5 \mathrm{~V}$ and $\mathrm{I}_{\text {LOAD }}=10 \mathrm{~mA}$.

1. Find duty cycle

$$
D C=\left(\frac{V_{\text {OUT }}-V_{\text {IN }}+V_{D}}{V_{\text {OUT }}-V_{\text {SAT }}+V_{D}}\right)=\left(\frac{5-2+0.4}{5-0.2+0.4}\right)=0.654
$$

Because duty cycle is less than the LT1316 minimum specification (0.73), the circuit can be designed for continuous operation.
2. $I_{\text {PEAK }}=\frac{2\left(I_{\text {OUT }}\right)}{1-D C}=\frac{2(10 \mathrm{~mA})}{1-0.654}=58 \mathrm{~mA}$
3. Find L

$$
\begin{aligned}
L & =\left(\frac{V_{\text {OUT }}-V_{\text {IN }}+V_{D}}{0.4\left(I_{\text {PEAK }}\right)}\right) t_{\text {OFF }} \\
& =\left(\frac{5-2+0.4}{0.4(58 \mathrm{~mA})}\right) 2 \mu \mathrm{~s} \\
& =293 \mu \mathrm{H}
\end{aligned}
$$

## 4. Find RSET resistor

$$
\begin{aligned}
\text { Overshoot } & =\left(\frac{\mathrm{V}_{\text {IN }}}{\mathrm{L}}\right) 300 \mathrm{~ns} \\
& =\left(\frac{2}{330 \mu \mathrm{H}}\right)=1.8 \mathrm{~mA}
\end{aligned}
$$

Find $R_{\text {SET }}$ from Figure 3 for $58 \mathrm{~mA}-1.8 \mathrm{~mA}=56.2 \mathrm{~mA}$ $R_{S E T} \approx 47 \mathrm{k}$

## Design Example 2

Requirements: $\mathrm{V}_{\text {IN }}=3.3 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=28 \mathrm{~V}$ and $\mathrm{I}_{\text {LOAD }}=5 \mathrm{~mA}$.

1. Find duty cycle:
$D C=\left(\frac{V_{\text {OUT }}-V_{\text {IN }}+V_{D}}{V_{\text {OUT }}-V_{S A T}+V_{D}}\right)=\left(\frac{28-3.3+0.4}{28-0.2+0.4}\right)=0.89$
Because duty cycle exceeds LT1316 minimum specification of $73 \%$, the circuit must be designed for discontinuous operation.

## 2. Find $\mathrm{P}_{\text {OUt (MAX) }}$

Multiply $P_{\text {OUT }}$ by 1.4 to give a safe operating margin
$\mathrm{P}_{\text {OUT }(\text { MAX })}=\mathrm{P}_{\text {OUT }}(1.4)=(5 \mathrm{~mA})(28 \mathrm{~V})(1.4)=0.196 \mathrm{~W}$
3. Set the on-time to the data sheet minimum of $3.4 \mu \mathrm{~s}$ and find L

$$
\begin{aligned}
L & =\frac{\left(t_{O N}{ }^{2}\right)\left(\mathrm{V}_{\text {IN }}-V_{S A T}\right)^{2}}{2 P_{O U T}(\mathrm{MAX})\left(\mathrm{t}_{\mathrm{ON}}+\mathrm{t}_{\mathrm{OFF}}\right)} \\
& =\frac{\left(3.4 \mu \mathrm{~S}^{2}\right)(3.3-0.2)^{2}}{2(0.196 \mathrm{~W})(3.4 \mu \mathrm{~S}+2 \mu \mathrm{~s})}=52 \mu \mathrm{H}
\end{aligned}
$$

## APPLICATIONS INFORMATION

4. Find $\mathrm{I}_{\text {PEAK }}$ for $3.4 \mu \mathrm{~S}$ on-time

$$
\begin{aligned}
\mathrm{I}_{\text {PEAK }} & =\frac{t_{O N}\left(\mathrm{~V}_{\text {IN }}-\mathrm{V}_{\text {SAT }}\right)}{\mathrm{L}}=\frac{3.4 \mu \mathrm{~s}(3.3-0.2)}{52 \mu \mathrm{H}} \\
& =0.202 \mathrm{~A}
\end{aligned}
$$

5. Find $R_{\text {SET }}$ resistor

$$
\begin{aligned}
\text { Overshoot } & =\left(\frac{V_{\text {IN }}}{\mathrm{L}}\right) 300 \mathrm{~ns} \\
& =\left(\frac{3.3}{52 \mu \mathrm{H}}\right) 300 \mathrm{~ns}=19 \mathrm{~mA}
\end{aligned}
$$

Find RSET from Figure 3 for $0.202 \mathrm{~A}-19 \mathrm{~mA}=0.183 \mathrm{~A}$

$$
R_{S E T} \approx 13 \mathrm{k}
$$

These discontinuous mode equations are designed to minimize peak current at the expense of inductor size. If smaller inductors are desired peak current must be increased.

## Capacitor Selection

Low ESR (Equivalent Series Resistance) capacitors should be used at the output of the LT1316 to minimize output ripple voltage. High quality input bypassing is also required. For surface mount applications AVX TPS series tantalum capacitors are recommended. These have been specifically designed for switch mode power supplies and have low ESR along with high surge current ratings.

For through-hole applications Sanyo OS-CON capacitors offer extremely low ESR in a small package size. If peak switch current is reduced using the $\mathrm{R}_{\text {SET }}$ pin, capacitor requirements can be eased and smaller, higher ESR units can be used. Ordinary generic capacitors can generally be used when peak switch current is less than 100 mA , although output voltage ripple may increase.

## Diodes

Most of the application circuits on this data sheet specify the Motorola MBR0520L surface mount Schottky diode. This 0.5A, low drop diode suits the LT1316 well. In lower current applications, a 1N4148 can be used although efficiency will suffer due to the higher forward drop. This effect is particularly noticeable at low output voltages. For higher output voltage applications, such as LCD bias generators, the extra drop is a small percentage of the output voltage so the efficiency penalty is small. The low cost of the 1N4148 makes it attractive wherever it can be used. In through-hole applications the 1N5818 is the all around best choice.

## Lowering Output Ripple Voltage

To obtain lower output ripple voltage, a small feedforward capacitor of about 50 pF to 100 pF may be placed from $V_{\text {OUT }}$ to FB as detailed in Figure 6. Ripple voltages with and without the added capacitor are pictured in Figures 7 and 8.

Figure 6. 2-Cell to 5V Step-Up Converter with Reduced Output Ripple Voltage

## APPLICATIONS INFORMATION

Figure 7. Switching Waveforms for the Circuit Shown in Figure 7 Without C1. The Output Ripple Voltage is Approximately 140 mV P-p

## Layout/Input Bypassing

The LT1316's high speed switching mandates careful attention to PC board layout. Suggested component placement is shown in Figure 9. The input supply must have low impedance at AC and the input capacitor should be placed as indicated in the figure. The value of this capacitor depends on how close the input supply is to the IC. In situations where the input supply is more than a few inches away from the IC, a $47 \mu$ F to $100 \mu$ F solid tantalum bypass capacitor is required. If the input supply is close to the IC, a $1 \mu$ F ceramic capacitor can be used instead. The LT1316 switches current in pulses up to 0.5 A , so a low impedance supply must be available. If the power source (for example, a 2 AA cell battery) is within 1 or 2 inches of the IC, the battery itself provides bulk capacitance and the

Figure 8. By Adding C1, Output Ripple Voltage is Reduced to Less Than 80 mV P-p
$1 \mu \mathrm{~F}$ ceramic capacitor acts to smooth voltage spikes at switch turn-on and turn-off. If the power source is far away from the IC, inductance in the power source leads results in high impedance at high frequency. A local high capacitance bypass is then required to restore low impedance at the IC.

## Low-Battery Detector

The LT1316 contains an independent low-battery detector that remains active when the device is shut down. This detector, actually a hysteretic comparator, has an open collector output that can sink up to $500 \mu \mathrm{~A}$. The comparator also operates below the switcher's undervoltage lockout threshold, operating until $\bigvee_{\text {IN }}$ reaches approximately 1.4 V .

Figure 9. Suggested PC Layout

Efficiency vs Load Current

## TYPICAL APPLICATIONS

Positive-to-Negative Converter for LCD Bias

When Solenoid Is Energized ( $V_{\text {ENERGIzE }}$ High) Peak Input Current Remains Low and Controlled, Maximizing Battery Life

TYPICAL APPLICATIONS
Super Cap Backup Supply

$\mathrm{C}_{\text {IN }}, \mathrm{C}_{\text {OUT: }}$ TAJB330M010R
CSUP: PANASONIC EEC-S5R5V104

L1: SUMIDA CD43-470

50V to 6V Isolated Flyback Converter

www.BDTIC.com/Linear

## TYPICAL APPLICATIONS

LCD Bias Generator with Output Disconnect in Shutdown

Universal Serial Bus (USB) to 5V/100mA DC/DC Converter

## PACKAGE DESCRIPTION

Dimensions in inches (millimeter) unless otherwise noted.

MS8 Package<br>8-Lead Plastic MSOP<br>(LTC DWG \# 05-08-1660)

* DIMENSION DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH,

PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.006 " ( 0.152 mm ) PER SIDE
** DIMENSION DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSIONS. INTERLEAD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE MSOP (MS88) 1197

S8 Package
8-Lead Plastic Small Outline (Narrow 0.150)
(LTC DWG \# 05-08-1610)

*DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006 " ( 0.152 mm ) PER SIDE
*DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010 " ( 0.254 mm ) PER SIDE

Information furnishec $b$ Lea lec Inbl gy corporation is believed to/b accurate and reliable. tation that the interconnection of circuits as described herein will not infringe on existing patent rights.

## TYPICAL APPLICATIONS

Low Profile 2 Cell-to-28V Converter for LCD Bias

C1: MURATA GRM235Y5V106Z010
C2: SPRAGUE 293D105X9035B2T
C3: $0.33 \mu \mathrm{~F}$ CERAMIC, 50 V
C4: 100 pF CERAMIC, 50 V
D1: BAT-54
L1: MURATA LQH3C22OK04
Bipolar LCD Bias Supply

## RELATED PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :---: | :---: | :---: |
| LTC ${ }^{\text {® }} 1163$ | Triple High Side Driver for 2-Cell Inputs | 1.8V Minimum Input, Drives N-Channel MOSFETs |
| LTC1174 | Micropower Step-Down DC/DC Converter | $94 \%$ Efficiency, $130 \mu \mathrm{~A} \mathrm{I}_{\mathrm{Q}}, 9 \mathrm{~V}$ to 5 V at 300 mA |
| LT1302 | High Output Current Micropower DC/DC Converter | $5 \mathrm{~V} / 600 \mathrm{~mA}$ from 2V, 2 A Internal Switch, $200 \mu \mathrm{I} \mathrm{I}_{Q}$ |
| LT1304 | 2-Cell Micropower DC/DC Converter | Low-Battery Detector Active in Shutdown, 5V at 200mA for 2 Cells |
| LT1307 | Single Cell Micropower 600kHz PWM DC/DC Converter | 3.3 V at 75 mA from 1 Cell |
| LTC1440/1/2 | Ultralow Power Single/Dual Comparators with Reference | $2.8 \mu \mathrm{~A} \mathrm{I}_{\mathrm{Q}}$, Adjustable Hysteresis |
| LTC1516 | 2-Cell to 5V Regulated Charge Pump | $12 \mu \mathrm{~A} \mathrm{I}_{\mathrm{Q}}$, No Inductors, 5 V at 50 mA from 3 V Input |
| $\underline{\text { LT1521 }}$ | Micropower Low Dropout Linear Regulator | 500 mV Dropout, 300 mA Current, $12 \mu \mathrm{~A} \mathrm{I}_{Q}$ |
