Software-Selectable Multiprotocol Transceiver with Termination

FEATURES

- **Software-Selectable Transceiver Supports: RS232, RS449, EIA530, EIA530-A, V.35, V.36, X.21**
- TUV Telecom Services Inc. Certified NET1, NET2 and TBR2 Compliant
- On-Chip Cable Termination
- **Pin Compatible with LTC1543**
- Complete DTE or DCE Port with LTC1544
- Operates from Single 5V Supply
- Small Footprint

APPLICATIONS

- Data Networking
- CSU and DSU
- Data Routers

DESCRIPTION

The LTC®1546 is a 3-driver/3-receiver multiprotocol transceiver with on-chip cable termination. When combined with the LTC1544, this chip set forms a complete software-selectable DTE or DCE interface port that supports the RS232, RS449, EIA530, EIA530-A, V.35, V.36 and X.21 protocols. All necessary cable termination is provided inside the LTC1546. In most applications, the LTC1546 replaces both an LTC1543 and an LTC1344A without any changes to the PC board.

The LTC1546 runs from a single 5V supply using an internal charge pump that requires only five space-saving surface mounted capacitors. The LTC1546 is available in a 28-lead SSOP surface mount package.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Complete DTE or DCE Multiprotocol Serial Interface with DB-25 Connector
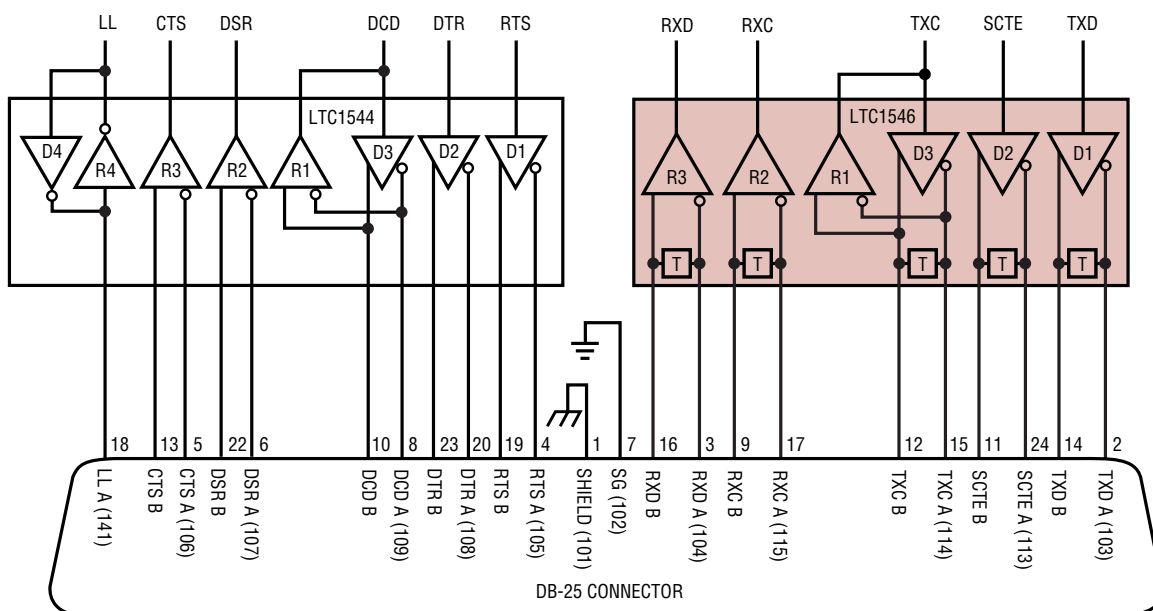

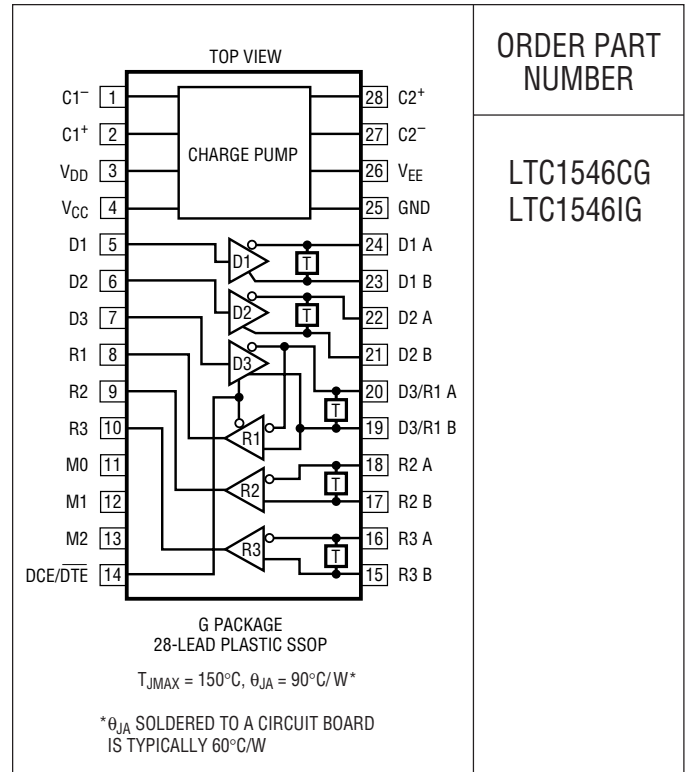

ABSOLUTE MAXIMUM RATINGS

(Note 1)

Supply Voltage 6.5V
Input Voltage
    Transmitters .... -0.3V to (V_{CC} + 0.3V)
    Receivers .... -18V to 18V
    Logic Pins .... -0.3V to (V_{CC} + 0.3V)
Output Voltage
    Transmitters .... (V_{EE} – 0.3V) to (V_{DD} + 0.3V)
    Receivers .... -0.3V to (V_{CC} + 0.3V)
    V_{EE} .... -10V to 0.3V
    V_{DD} .... -0.3V to 10V
Short-Circuit Duration
    Transmitter Output .... Indefinite
    Receiver Output .... Indefinite
    V_{EE} .... 30 sec
Operating Temperature Range
    LTC1546C ....0°C to 70°C
    LTC1546I .... -40°C to 85°C
Storage Temperature Range .... -65°C to 150°C
Lead Temperature (Soldering, 10 sec)................. 300°C

APPLICATIONS INFORMATION

Overview

The LTC1546 and LTC1544 form a complete software-selectable DTE or DCE interface port that supports the RS232, RS449, EIA530, EIA530-A, V.35, V.36 and X.21 protocols. Cable termination is provided on-chip, eliminating the need for discrete termination designs.

A complete DCE-to-DTE interface operating in EIA530 mode is shown in Figure 17. The LTC1546 half of each port is used to generate and appropriately terminate the clock and data signals. The LTC1544 is used to generate the control signals along with LL (Local Loopback).

Mode Selection

The interface protocol is selected using the mode select pins M0, M1 and M2 (see Table 1).

For example, if the port is configured as a V.35 interface, the mode selection pins should be M2 = 1, M1 = 0, M0 = 0. For the control signals, the drivers and receivers will operate in V.28 (RS232) electrical mode. For the clock and data signals, the drivers and receivers will operate in V.35

electrical mode. The DCE/$\overline{\text{DTE}}$ pin will configure the port for DCE mode when high, and DTE when low.

The interface protocol may be selected simply by plugging the appropriate interface cable into the connector. The mode pins are routed to the connector and are left unconnected (1) or wired to ground (0) in the cable as shown in Figure 18. The internal pull-up current sources will ensure a binary 1 when a pin is left unconnected.

The mode selection may also be accomplished by using jumpers to connect the mode pins to ground or V_{CC}.

When the cable is removed, leaving all mode pins unconnected, the LTC1546/LTC1544 will enter no-cable mode. In this mode the LTC1546/LTC1544 supply current drops to less than 500µA and the LTC1546/LTC1544 driver outputs are forced into a high impedance state. At the same time, the R2 and R3 receivers of the LTC1546 are differentially terminated with 103Ω and the other receivers on the LTC1546 and LTC1544 are terminated with 30kΩ to ground.
APPLICATIONS INFORMATION

Figure 17. Complete Multiprotocol Interface in EIA530 Mode

Cable Termination

Traditional implementations used expensive relays to switch resistors or required the user to change termination modules every time a new interface standard was selected. Switching the terminations with FETs is difficult because the FETs must remain off when the signal voltage is beyond the supply voltage. Alternatively, custom cables

may contain termination in the cable head or route signals to various terminations on the board.

The LTC1546/LTC1544 chipset solves the cable termination switching problem by automatically providing the appropriate termination and switching on-chip for the V.10 (RS423), V.11 (RS422), V.28 (RS232) and V.35 electrical protocols.

www.BDTIC.com/Linear

LINEAR TECHNOLOGY
APPLICATIONS INFORMATION

Figure 18: Single Port DCE V.35 Mode Selection in the Cable

V.10 (RS423) Interface

All V.10 drivers and receivers necessary for the RS449, EIA530, EIA530-A, V.36 and X.21 protocols are implemented on the LTC1544.

A typical V.10 unbalanced interface is shown in Figure 19. A V.10 single-ended generator with output A and ground C is connected to a differential receiver with input A' connected to A, and ground C' connected via the signal return to ground C. Usually, no cable termination is required for V.10 interfaces, but the receiver inputs must be compliant with the impedance curve shown in Figure 20.
The V.10 receiver configuration in the LTC1544 is shown in Figure 21. In V.10 mode, switch S3 inside the LTC1544 is turned off. The noninverting input is disconnected inside the LTC1544 receiver and connected to ground. The cable termination is then the 30k input impedance to ground of the LTC1544 V.10 receiver.

V.11 (RS422) Interface

A typical V.11 balanced interface is shown in Figure 22. A V.11 differential generator with outputs A and B and ground C is connected to a differential receiver with input A' connected to A, input B' connected to B, and ground C' connected via the signal return to ground C. The V.11

Figure 19. Typical V.10 Interface

Figure 20. V.10 Receiver Input Impedance

APPLICATIONS INFORMATION

Figure 21. V.10 Receiver Configuration

Figure 22. Typical V.11 Interface

interface has a differential termination at the receiver end that has a minimum value of 100Ω. The termination resistor is optional in the V.11 specification, but for the high speed clock and data lines, the termination is essential to prevent reflections from corrupting the data. The receiver inputs must also be compliant with the impedance curve shown in Figure 20.

In V.11 mode, all switches are off except S1 of the LTC1546's receivers which connects a 103Ω differential termination impedance to the cable as shown in Figure 23[1]. The LTC1544 only handles control signals, so no termination other than its V.11 receivers' 30k input impedance is necessary.

V.28 (RS232) Interface

A typical V.28 unbalanced interface is shown in Figure 24. A V.28 single-ended generator with output A and ground C is connected to a single-ended receiver with input A'

Figure 23. V.11 Receiver Configuration
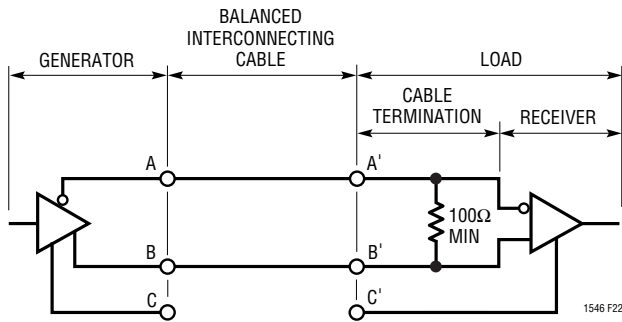

connected to A and ground C' connected via the signal return to ground C.

In V.28 mode, S3 is closed inside the LTC1546/LTC1544 which connects a 6k (R8) impedance to ground in parallel with 20k (R5) plus 10k (R6) for a combined impedance of 5k as shown in Figure 25. Proper termination is only provided when the B input of the receivers is floating, since S1 of the LTC1546's R2 and R3 receivers remains on in V.28 mode[1]. The noninverting input is disconnected inside the LTC1546/LTC1544 receiver and connected to a TTL level reference voltage to give a 1.4V receiver trip point.

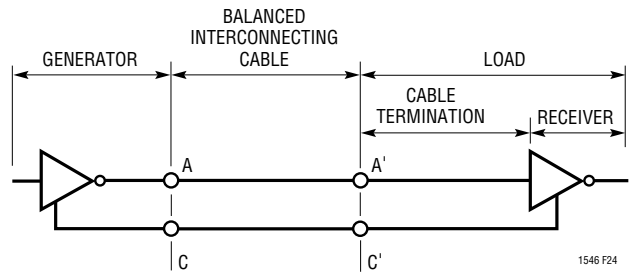

**Figure 24. Typical V.28 Interface**

Figure 25. V.28 Receiver Configuration

[1]Actually, there is no switch S1 in receivers R2 and R3. However, for simplicity, all termination networks on the LTC1546 can be treated identically if it is assumed that an S1 switch exists and is always closed on the R2 and R3 receivers.

www.BDTIC.com/Linear

APPLICATIONS INFORMATION

V.35 Interface

A typical V.35 balanced interface is shown in Figure 26. A V.35 differential generator with outputs A and B and ground C is connected to a differential receiver with input A' connected to A, input B' connected to B, and ground C' connected via the signal return to ground C. The V.35 interface requires a T or delta network termination at the receiver end and the generator end. The receiver differential impedance measured at the connector must be 100Ω ±10Ω, and the impedance between shorted terminals (A' and B') and ground (C') must be 150Ω ±15Ω.

In V.35 mode, both switches S1 and S2 inside the LTC1546 are on, connecting a T network impedance as shown in Figure 27. The 30k input impedance of the receiver is placed in parallel with the T network termination, but does not affect the overall input impedance significantly.

The generator differential impedance must be 50Ω to 150Ω and the impedance between shorted terminals (A and B) and ground (C) must be 150Ω ±15Ω.
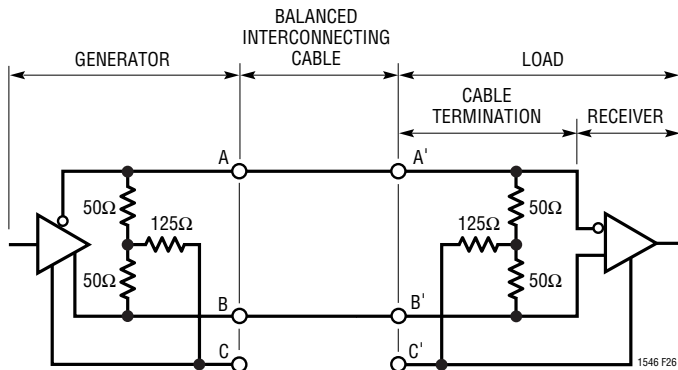

No-Cable Mode

The no-cable mode (M0 = M1 = M2 = 1) is intended for the case when the cable is disconnected from the connector. The charge pump, bias circuitry, drivers and receivers are turned off, the driver outputs are forced into a high impedance state, and the supply current drops to less than 200μA. Note that the LTC1546's R2 and R3 receivers continue to be terminated by a 103Ω differential impedance.

Charge Pump

The LTC1546 uses an internal capacitive charge pump to generate V_{DD} and V_{EE} as shown in Figure 28. A voltage doubler generates about 8V on V_{DD} and a voltage inverter generates about –7.5V on V_{EE}. Four 1μF surface mounted tantalum or ceramic capacitors are required for C1, C2, C3 and C4. The V_{EE} capacitor C5 should be a minimum of 3.3μF. All capacitors are 16V and should be placed as close as possible to the LTC1546 to reduce EMI.

Figure 26. Typical V.35 Interface
Figure 28. Charge Pump

Receiver Fail-Safe

All LTC1546/LTC1544 receivers feature fail-safe operation in all modes. If the receiver inputs are left floating or are shorted together by a termination resistor, the receiver output will always be forced to a logic high.

DTE vs DCE Operation

The DCE/$\overline{\text{DTE}}$ pin acts as an enable for Driver 3/Receiver 1 in the LTC1546, and Driver 3/Receiver 1 and Driver 4/Receiver 4 in the LTC1544. The INVERT pin in the LTC1544 allows the Driver 4/Receiver 4 enable to be high or low true polarity.

Figure 27. V.35 Receiver Configuration

APPLICATIONS INFORMATION

The LTC1546/LTC1544 can be configured for either DTE or DCE operation in one of two ways: a dedicated DTE or DCE port with a connector of appropriate gender or a port with one connector that can be configured for DTE or DCE operation by rerouting the signals to the LTC1546/LTC1544 using a dedicated DTE cable or dedicated DCE cable.

A dedicated DTE port using a DB-25 male connector is shown in Figure 29. The interface mode is selected by logic outputs from the controller or from jumpers to either V_{CC} or GND on the mode select pins. A dedicated DCE port using a DB-25 female connector is shown in Figure 30.

A port with one DB-25 connector, that can be configured for either DTE or DCE operation is shown in Figure 31. The configuration requires separate cables for proper signal routing in DTE or DCE operation. For example, in DTE mode, the TXD signal is routed to Pins 2 and 14 via the LTC1546's Driver 1. In DCE mode, Driver 1 now routes the RXD signal to Pins 2 and 14.

Multiprotocol Interface with RL, LL, TM and a DB-25 Connector

If the RL, LL and TM signals are implemented, there are not enough drivers and receivers available in the LTC1546/LTC1544. In Figure 32, the required control signals are handled by the LTC1545. The LTC1545 has an additional single-ended driver/receiver pair that can handle two more optional control signals such as TM and RL.

Cable-Selectable Multiprotocol Interface

A cable-selectable multiprotocol DTE/DCE interface is shown in Figure 33. The select lines M0, M1 and DCE/$\overline{\text{DTE}}$ are brought out to the connector. The mode is selected by the cable by wiring M0 (connector Pin 18) and M1 (connector Pin 21) and DCE/$\overline{\text{DTE}}$ (connector Pin 25) to ground (connector Pin 7) or letting them float. If M0, M1 or DCE/$\overline{\text{DTE}}$ is floating, internal pull-up current sources will pull the signals to V_{CC}. The select bit M2 is hard wired to V_{CC}. When the cable is pulled out, the interface will go into the no-cable mode.

Compliance Testing

The LTC1546/LTC1544 chipset has been tested by TUV Telecom Services Inc. and passed the NET1, NET2 and TBR2 requirements. Copies of the test reports are available from LTC or TUV Telecom Services.

The titles of the reports are:

NET1 and NET2: Test Report No. NET2/091301/99.

TBR2: Test Report No. CRT2/091301/99.
